Dear Martin:

On behalf of Modottel Co., Ltd., is our response to your e-mail dated May 14, 2002 requesting additional information for the subject application.

1. Attached is the retested SAR data using 1900MHz liquid parameters and certified probe conversion factors. The attached data was retested at the two highest SAR points for left and right head, and body. Also attached are dipole validation, printouts of the measured liquid parameters, and the manufacturer's probe calibration certification for the probe used during the evaluation.
2. For this particular clamshell type device the SAR "Hot Spot" resided near the bottom of the LCD when placed in the cheek touch position against the phantom. This translates to the "Hot Spot" being in the chin area of the phantom. In order to maintain the E-field probe to within +/- 30 degrees normal to the inner surface of the phantom, the DASY3 had to tilted towards the chin area. This results in a smaller than usual area scan available due to possible E-field probe collisions with the phantom. The device was previously inspected throughout the entire area of the phantom head in order to determine the area of SAR concentration.

If you have any questions or comments concerning the above, please do not hesitate to contact me.

Sincerely,

Additional Conversion Factors for Dosimetric E-Field Probe

Type:

ET3DV6

Serial Number:

1387

Place of Assessment:

Zurich

Date of Assessment:

February 25, 2002

Probe Calibration Date:

February 22, 2002

Schmid & Partner Engineering AG hereby certifies that conversion factor(s) of this probe have been evaluated on the date indicated above. The assessment was performed using the FDTD numerical code SEMCAD of Schmid & Partner Engineering AG. Since the evaluation is coupled with measured conversion factors, it has to be recalculated yearly, i.e., following the re-calibration schedule of the probe. The uncertainty of the numerical assessment is based on the extrapolation from measured value at 900 MHz or at 1800 MHz.
