

RF Test Report

Project Number: 5045970

Offer Number: SUW-202212003797

Report Number: 5045970EMC02

Revision Level: 1

Client: Philips Medical Systems

Equipment Under Test: Telemetry Monitor

Product Name: Philips Telemetry Monitor 5500

Model Number: 867232

FCC ID: PQC-5500SH1A4

IC: 3549B-5500SH1A4

Applicable Standards: FCC Part 95 Subpart H (WMTS)

RSS-210 Issue 11 (Annex C); RSS-GEN Issue 5

ANSI C63.26-2015

Report issued on: 09 July 2025

Test Result: Compliant

FOR THE SCOPE OF ACCREDITATION UNDER CERTIFICATE NUMBER: 3212.01

Report must not be used by the client to claim product certification, approval, or endorsement by A2LA, NIST, or any agency of the Federal Government.

Antenna Requirement	15.203	RSS-GEN 6.8	Compliant ⁽²⁾

(1) The EUT has no facility to connect to AC Mains.

(2) The device uses an internal PCB trace antenna which cannot be replaced by the end user.

1.1 Modifications Required for Compliance

None

2 General Information

2.1 Client Information

Company Name: Philips Medical Systems North America Co.
 Address: 222 Jacobs Street
 City, State, Zip, Country: Cambridge, MA 02141, USA

2.2 Test Laboratory

Name: SGS North America, Inc.
 Address: 620 Old Peachtree Road NW, Suite 100
 City, State, Zip, Country: Suwanee, GA 30024, USA

Accrediting Body: A2LA
 Type of lab: Testing Laboratory
 Certificate Number: 3212.01
 CAB Identification: US0186

2.3 General Information of EUT

Equipment Under Test: Telemetry Monitor
 Product Name: Philips Telemetry Monitor 5500
 Model Number: 867232
 Serial Numbers: USPP000164 (Conducted Sample)
 USPP000091 (Radiated Sample)
 FCC ID: PQC-5500SH1A4
 IC: 3549B-5500SH1A4

 Frequency Ranges: 1395 – 1400 MHz (USA & Canada)
 1427 – 1432 MHz (USA)
 1427 – 1429.5 MHz (Canada)
 Data Modes: Smart Hopping (GFSK/BPSK/QPSK/8PSK) WMTS
 Antenna: PCB Planar Antenna (2.0dBi peak gain)*

 Rated Voltage: 4.5V_{DC}
 Test Voltage: 4.5V_{DC} (from three D cell batteries or via USB from laptop)

 Sample Received Date: 18 May 2023
 Dates of testing: 26 June to 26 July 2023

*Data was not measured by SGS laboratory and therefore SGS is not responsible for accuracy. Data obtained via customer, specification sheet, previous filing or other.

2.4 Operating Modes and Conditions

The EUT was running test mode firmware which allowed commands to be sent to transmit on all supported channels and with all supported modulations for each channel. The test mode commands were configured to transmit at the maximum output power defined for each channel. The transmitted signals had very low duty cycles; however, the max hold function on the spectrum analyzer was used to capture the peak signal levels during transmit on times, and duty cycle correction was used if needed.

1	DC Power	Test Power Adapter	EUT	0.15	N	N
2	DC Power	Laptop Computer	EUT	0.80	N	N

3 Occupied Bandwidth

3.1 Test Result

Test Description	Test Specification		Test Result
Occupied Bandwidth	FCC 2.1049	RSS-GEN 6.7	Reported

3.2 Test Method

The WMTS antenna port of the EUT conducted sample was connected directly to a spectrum analyzer using a coaxial cable and attenuator. The procedures from ANSI C63.26-2015 clause 5.4.4 were used to determine the 99% bandwidth.

Example Plot

Date: 26. JUL. 2023 19:02:33

Note: Cable and attenuator losses were accounted for in spectrum analyzer offset.

5 Frequency Accuracy

5.1 Test Result

Test Description	Test Specification		Test Result
Frequency Accuracy	95.2365	RSS-210 C.4(d)	Compliant

5.2 Test Method

The WMTS antenna port of the EUT conducted sample was connected directly to a spectrum analyzer using a coaxial cable. Frequency accuracy was tested and verified to maintain the fundamental emissions within the designated bands of operation over the manufacturer's stated temperature range of 0°C to 37°C.

The channels closest to the band edges were measured.

5.3 Test Site

SGS EMC Laboratory, Suwanee, GA

Environmental Conditions

Temperature: 23.8 °C
Relative Humidity: 51.9 %
Atmospheric Pressure: 98.0 kPa

5.4 Test Equipment

Test End Date: 3-Jul-2023

Tester: MT

6 Field Strength of Fundamental

6.1 Test Result

Test Description	Test Specification		Test Result
Field Strength of Fundamental	95.2369(b)	RSS-210 C.4(a)	Compliant

6.2 Test Method

The fundamental field strength limit shown below is for measurements using an average detector. However, test data was measured using a peak detector and was found to meet this limit, which also shows compliance. This method was preferred due to the low duty cycle of the transmit signals.

The EUT radiated sample was oriented in each of its three orthogonal axes and data for each was reported. The receiver's resolution bandwidth was set to 1MHz. Measurements were made with the antenna positioned at a 3m distance from the EUT in both the horizontal and vertical planes of polarization. The antenna height was varied from 1 m to 4 m and the EUT was rotated 360° to find the maximum emitting point for each frequency. The radiated measurements were recorded and compared to the limit given below.

Limit (from FCC §95.2369(b):

For WMTS transmitter types operating in the 1395–1400 MHz and 1427–1432 MHz bands, the field strength of the transmitted signal must not exceed 740 mV/m, measured at 3 meters, using instrumentation with an averaging detector and a 1 MHz reference bandwidth.

Note: 740 mV/m equates to 117.4 dBuV/m

Example Plot

7 Field Strength of Spurious Emissions

7.1 Test Result

Test Description	Test Specification		Test Result
Field Strength of Spurious Emissions	95.2379	RSS-210 C.4(b)(c)	Compliant

7.2 Test Method

Exploratory scans were performed using the max hold function and incorporating a peak detector and using TILE! software. The final test data was measured using a quasi-peak detector below 960MHz and average and peak detectors above 960MHz. For harmonics of the fundamental, average measurements were made by correcting the peak value with the duty cycle correction factor (DCCF). For emissions other than harmonics of the fundamental, measurements were made using both the average and peak detectors. The receiver's resolution bandwidth was set to 120 kHz for measurements taken in the 30 MHz to 960 MHz frequency range and 1MHz for measurements 960 MHz and higher. Measurements were made with the antenna positioned in both the horizontal and vertical planes of polarization. The antenna height was varied from 1 m to 4 m and the EUT was rotated 360° to find the maximum emitting point for each frequency. The EUT was tested in each of its three orthogonal axes and the worst-case data was reported. The radiated measurements were recorded and compared to the limits shown below.

Limits (from FCC §95.2379):

- (a) Unwanted emissions on frequencies below 960 MHz must not exceed 200 μ V/m, measured at a distance of 3 meters using measuring instrumentation with a CISPR quasi-peak detector.
- (b) Unwanted emissions on frequencies above 960 MHz must not exceed 500 μ V/m, measured at a distance of 3 meters using measuring equipment with an averaging detector and a 1 MHz measurement bandwidth.

Note: 200 μ V/m equates to 46 dB μ V/m and 500 μ V/m equates to 54 dB μ V/m

Peak limits are 20dB higher than the average limits.

Spurious emissions shall meet the average and peak limits indicated above. Also, emissions that fall in the restricted bands given in §15.205 shall meet the general emission limits of §15.209.

7.6 Duty Cycle Correction Factor (DCCF)

Duty Cycle				
Configuration	Tx On Time (ms)	Period, T (ms)	Duty Cycle (%)	DCCF (dB)
Normal	3.1	100.0	3.1 ¹	-20 ²

Notes: (1) Duty cycle information and data was provided by the client; it was not measured by SGS.

(2) Limited to -20dB from peak to average (although 3.1% duty cycle would call for -30.2dB).

7.7 Test Data – 30-960 MHz

Emissions in the 30-960 MHz range were similar regardless of channel or EUT axis (worst-case shown).

Avg Value = Raw Pk + AF + CL + DCCF - Amp

Margin = Avg Value - Limit

8 Measurement Uncertainty

The measurement uncertainty figures are calculated in accordance with TR 100 028-1 [2] and correspond to an expansion factor (coverage factor) $k = 2$ (which provides confidence levels of 95.45 % in the case where the distributions characterizing the actual measurement uncertainties are normal (Gaussian)).

Parameter	Expanded Uncertainty for Normal k factor equal to 2	
	Required	Laboratory Actual
Radio Frequency	$\pm 1 \times 10^{-5}$	$\pm 9.8 \times 10^{-8}$
total RF power, conducted	± 1.5 dB	± 1.2 dB
RF power density, conducted	± 3 dB	± 0.7 dB
spurious emissions, conducted	± 3 dB	± 2.1 dB
all emissions, radiated	± 6 dB	± 4.8 dB
temperature	$\pm 1^{\circ}\text{C}$	$\pm 0.5^{\circ}\text{C}$
humidity	± 5 %	$\pm 3.5\%$
DC and low frequency voltages	± 3 %	$\pm 0.4\%$
Conducted disturbance at mains port using AMN	± 3.4 dB	± 2.5 dB

9 Revision History

Revision Level	Description of changes	Revision Date
0	Initial release	02 November 2023
1	- Updated RSS-210 to latest issue on title page - Added ANSI C63.26 reference on title page - Changed ANSI C63.10 to ANSI C63.26 in various sections	09 July 2025
