Standard: FCC Rules and Regulations Part 2.1053 and 90

ENGINEERING SUMMARY

This report contains the results of Field Strength of Spurious Radiation measurement performed on a THALES e-TRANSACTIONS, INC. **Artema DataTAC POS Terminal**, model P4432-054E & -056E in accordance with the FCC Rules and Regulations Part 2.1053 and 90. The product was evaluated for spurious radiation when it was set at the high, medium and low frequency channels.

The measurements were carried out using 1) direct method and 2) substitution method both as radiated.

The results for Direct Method are given in tables 1 to 6 and for Substitution Method in Tables 1A to 6A.

The sample of the Artema P4432-054E & -056E with FCC IDENTIFIER **PSMDATATAC002** covered by this report complies with the applicable requirements of the FCC Rules and Regulations Part 2.1053 and 90.210

The results presented in this report relate only to the sample tested.

Summary of the Results

Test Description	Page No.	Test Set-up Figure No.	Results Summary
Field Strength of Spurious Radiation Ref. Paragraph 2.1053 and 90	8	1	Passed

INTRODUCTION

General

This report describes the results of the Field Strength of Spurious Radiation measurement conducted on a THALES e-TRANSACTIONS, INC. **Artema DataTAC POS Terminal**, model P4432-054E & -056E in accordance with the FCC Rules and Regulations Part 2.1053 and 90.

Test Facility

The tests were performed for THALES e-TRANSACTIONS, INC. by APREL Laboratories at APREL's EMI facility located in Nepean, Ontario, Canada. The laboratory operates an (3m and 10m) Open Area Test Site (OATS). The measurement facility is calibrated in accordance with ANSI C63.4-1992.

A description of the measurement facility in accordance with the radiated and AC line conducted test site criteria per ANSI C63.4-1992 is on file with the Federal Communications Commission and is in compliance with the requirements of Section 2.948 of the Commissions rules and regulations. **APREL's registration number is 90416.**

APREL is accredited by Standard Council of Canada. APREL is also accredited by Industry Canada and recognised by the Federal Communications Commissions (FCC).

Standard

The evaluation and analysis were conducted in accordance with FCC Rules and Regulations Parts 2.1053 and the appropriate limits (90).

Test Equipment

The test equipment used during the evaluation is listed in Appendix A with calibration due dates.

Environmental Conditions (Open Area Teas Area):

Temperature: 0 °C ± 2, Relative Humidity: 30 - 50 %, Air Pressure: 100kPa ± 3

Personnel:

The measurements were conducted by Y. Chen. The report was developed and written by Jay Sarkar.

FCC SUBMISSION INFORMATION

FCC ID:	PSMTDATATAC002
Equipment type:	Artema DataTAC POS Terminal
Model:	P4432-054E & -056E
For:	Certification
Applicant:	THALES e-TRANSACTIONS Inc. 53 Perimeter Center East, Suite 175 Atlanta, GA 30346 USA
Manufacturer:	THALES e-Transactions S.A. 9, rue Elsa Triolet F-78370 Plaisir France
Evaluated by:	APREL Laboratories 51 Spectrum Way Nepean, Ontario Canada K2R 1E6

MANUFACTURER'S DATA

FCC ID:	PSMDATATAC002
Equipment Type:	Artema DataTAC POS Terminal
Model:	P4432-054E & 056E
Reference:	FCC Rules and Regulations Parts 2 and Part 90
Manufacturer:	THALES e-Transactions S.A.
Power Source:	3.6 (nominal) VDC Battery, Lithium-ion
Development Stage of Unit:	Production

GENERAL SPECIFICATIONS

1. Frequency Range: 806.00 to 821.00 MHz (Transmitter)
2. Output Power: 1.70 W (ERP)
3. Emission Designators (See 47 CFR § 2.201 and §2.202): 20K0F1D
4. Antenna Impedance: 50 Ω

Measurement: Field Strength of Spurious Radiation

Ref: FCC Parts 2.1053 and 90.210

Criteria: Emission **Mask G:**
The permitted maximum level of spurious emission is $43 + 10 \log (P)$ dB below the unmodulated carrier power of the transmitter (P).

Set-up: See Figure 1.a

Conditions: Voltage Supply: DC Battery

Equipment: See Appendix A.

Methodology: A. Direct Method as Radiated (See Section B for Substitution Method).

The final measurements were taken at APREL Laboratory's open area test site (OATS) measurement facility. This open area test site is calibrated to ANSI C63.4 document and a description of the measurement facility is on file with the Federal Communications Commission and is in compliance with the requirements of Section 2.948 of the Commissions rules and regulations.
(FCC Registration No.:90416).

The **POS terminal** was configured to operate at maximum power with appropriate modulation. Special software was employed in order that the transmitter was processing data in a normal manner.

Prior to final measurement in the OATS, preliminary radiated spurious emissions were scanned in a shielded enclosure at a distance of 1 m using biconical, log-periodic and horn antennas in order to determine the characteristic frequencies of the field strength of spurious emissions. Based on this information, measurements were performed in the OATS at these characteristic frequencies using calibrated antennas.

All field strength measurements were made with a spectrum analyser and the appropriate calibrated antenna for the frequency range from 9 kHz up to 10th harmonics of the transmit frequency (see equipment list for the calibrated antenna used).

**Figure 1.a Test set up for the Field Strength of Spurious Radiation Measurement in OATS
(Not to scale)**

Fig. 1.b APREL's OATS (Open Area Test Site)

The equipment under test was placed on a turntable positioned 3 meters away from the calibrated receiving antenna, which in turn was connected to the spectrum analyzer. For each identified frequency, the received signal was maximised by the positioning of the turntable and the height of the antenna. The process was repeated for both horizontal and vertical polarisation.

Information submitted includes the relative radiated power of each spurious emissions with reference to the calculated 84.6 dB μ V/m limit per 90.210 assuming all emissions are radiated from half-wave dipole antenna.

Measurements given in the spurious emissions test result tables contain: analyzer reading, correction factor, and final reading. The final field strength level are derived from the analyzer measurement and the correction factor (antenna factor and cable loss) as shown in the following example:

Sample Calculation for direct method

A. Spectrum analyzer reading

At 1630.00 MHz, a spurious level of 46.1 dB μ V @ 3 meters is measured.

B. Correction factor (antenna factor and cable loss)

Cable loss: 2.5 dB

Antenna Factor: 26.4 dB

Total Correction Factor: 2.5 + 26.4 = 28.9 dB/m

C. Final reading (Field Strength of spurious emission):

$$C = A + B$$

$$C = 46.1 \text{ dB}\mu\text{V} + 28.9 \text{ dB/m}$$

$$C = 75.0 \text{ dB}\mu\text{V/m @ 3 meters}$$

D. The criteria level.

The field intensity, which would be produced by the transmitter carrier operating into a half-wave dipole antenna (gain of 1.64), at a distance of 3 m, was calculated using the following formula:

$$\text{Field Strength of Unmodulated Carrier (dB}\mu\text{V/m)} = 10\log_{10} (P_t G / 4\pi r^2) + 145.8 \text{ dB}$$

Pt is transmitter carrier power, unmodulated

G is gain, 1.64

R is distance, 3 meters

Criteria (reference) level at 3 meters from 1.70 Watt (ERP) into half-wave dipole antenna is 84.6 dBμV/m.

E = Margin (spurious emission below the reference level)

$$E = D - C$$

$$E = 84.6 \text{ dB}\mu\text{V/m} - 75.0 \text{ dB}\mu\text{V/m}$$

$$E = 9.6 \text{ dB}\mu\text{V/m}$$

B: Substitution Method (Radiated)

The ARTEMA was also tested for spurious radiated emissions using the substitution method with a procedure similar to that used in the ERP measurement and described in the ERP measurement portion of the Test Report. A set of three reference dipoles, a horn antenna and a signal generator to duplicate the signal were used. Signals radiated from the ARTEMA on the fundamental frequency as well as second and third harmonic were evaluated by comparing to the signals transmitted from the reference dipoles. The antenna used for the first three harmonics were a set of three dipoles, $l = 18.5 \text{ cm}$ (first harmonic/fundamental), $l = 9.2 \text{ cm}$ (second harmonic), and $l = 6.0 \text{ cm}$ (third harmonic). For testing the higher frequencies, fourth to 8th harmonics, a calibrated horn antenna with known gain was used as a replacement source of radiation thus substituting the ARTEMA. The duplicated reading (taken in dBm) was then referenced to the dipole.

Criteria: The criteria level using substitution method was calculated to be -13.0 dBm .

This level was obtained by using the following expression:

$$\text{ERP}_{\text{Limit (dBm)}} = \text{ERP}_{\text{Carrier (dBm)}} - [43 + 10 \cdot \log_{10} \text{ERP}_{(W)}]$$

Example:

$$\text{ERP}_{\text{Limit(dBm)}} = 32.8 \text{ dBm} - [43 + 10 \cdot \log_{10}(1.919 \text{ W})]$$

$$\text{ERP}_{\text{Limit(dBm)}} = 32.8 \text{ dBm} - (43 + 2.8) \text{ dB} = -13.0 \text{ dBm}$$

Results: **Passed** . **See Tables 1 and 2 for direct method**
 See Tables 3 and 4 for substitution method
