1.1 Notes

The test results of this test report relate exclusively to the test item specified in 1.5. The CETECOM ICT Services GmbH does not assume responsibility for any conclusions and generalisations drawn from the test results with regard to other specimens or samples of the type of the equipment represented by the test item. The test report may only be reproduced or published in full. Reproduction or publication of extracts from the report requires the prior written approval of the CETECOM ICT Services GmbH.

1.5 Test item

Type of equipment : **Bluetooth PCMCIA Card / RLAN**
Type designation : **Azure BT PC Card**
Manufacturer : applicant
Street :
City :
Country :
Serial number : See photographs

Additional informations: :

Frequency : 2400 – 2483.5 MHz
Type of modulation : 1M00FXD / 79M8FXD (FHSS)
Number of channels : 79
Antenna : integral antenna / print antenna
Power supply : 3,3/3,6/5,0 V DC from PC
Output power : EIRP: 0,27 mW
Type of equipment : Temperature range : -10°C - +40°C

1.6 Test standards: **FCC Part 15 §15.247**
CANADA RSS-210

2 Technical test

2.1 Summary of test results

The radiated measurements were performed vertical and horizontal over the whole frequency range. We start at 1 m high with vertical receiving antenna and rotate the dish continuously. During rotation we use the antenna lift system to vary the high from 1 to 4 m. So we find maximum radiation output. At this points we do manual remeasurements. After this we do the same measurements in horizontal position of the receiving antenna. This (horizontal and vertical) is made for all the three planes of the test sample. We use the maximum received results.

The detector function and selection of bandwidth are according ANSI C63.2-1996 item 8.2.1 and ANSI C63.4-1992 Item 4.2.

Antennas are conform with ANSI C63.2-1996 item 15.

150 kHz - 30 MHz: Quasi Peak measurement, 9kHz Bandwidth, passive loop antenna.

30 MHz - 200 MHz: Quasi Peak measurement, 120KHz Bandwidth, biconical antenna

200MHz - 1GHz: Quasi Peak measurement, 120KHz Bandwidth, log periodic antenna

1GHz: Average, RBW 1MHz, VBW 10 MHz, waveguide horn

The product fullfills also the requirements for CANACA RSS-210

No deviations from the technical specification(s) were ascertained in the course of the tests performed.

Final verdict : PASS

Time of occupancy (dwell time) for DH1

§15.247(a)

The system makes worst case 1600 hops per second or 1 time slot has a length of 625µs with 79 channels. A DH1 Packet need 1 time slot for transmitting and 1 time slot for receiving. Then the system makes worst case 800 hops per second with 79 channels. So you have each channel 10.13 times per second and for 30 seconds you have 303.9 times of appearance .

Each tx-time per appearance is 467.3647 µs.

So we have $303.9 * 467.3647 \mu s = 142.032 \text{ ms}$ per 30 seconds.

Date: 9.AUG.2001 10:53:03

Ambient temperature : 25°C

Relative humidity : 43%

Time of occupancy (dwell time) for DH3

§15.247(a)

A DH3 Packets need 3 time slots for transmit and 1 for receiving, then the system makes worst case 400 hops per second with 79 channels. So you have each channel 5.1 times per second and for 30 seconds you have 153 times of appearance .

Each tx-time per appearance is 1.7134 ms.

So we have $153 * 1.7134 \text{ ms} = 262.150 \text{ ms}$ per 30 seconds.

Date: 9.AUG.2001 10:50:46

Equipment under test : Azure BT PC Card

Ambient temperature : 25°C

Relative humidity : 43%

Time of occupancy (dwell time) for DH5

§15.247(a)

At DH5 Packets you need 5 time slots for transmit and 1 for receiving, so the system makes worst case 266,7 hops per second with 79 channels. So you have each channel 3.36 times per second and for 30 seconds you have 100,8 times of appearance .

Each tx-time per appearance is 2.9559 ms.

So we have $100,8 * 2.9559 \text{ ms} = 297.955 \text{ ms}$ per 30 seconds.

Date: 9.AUG.2001 10:49:02

Equipment under test : Azure BT PC Card

Ambient temperature : 25°C

Relative humidity : 43%

Time of occupancy (dwell time) for page mode /Inquiry mode (TX-on time) §15.247(a)

At paging mode the system makes first hopping with 16 channels. One sequence(called train A) lasts 10 ms. Every 1.28s frequencies change and a second train A starts with different frequencies. After max $7 \cdot 1.28$ s 16 new more distance frequencies (Train B) are used.

So we have in the worst case (same frequency is in every train) the following time scedule.

First: $7 \cdot 128 \cdot 10$ ms. For the next 7 seconds train B with other frequencies.

Then train A and B changes frequently.

⇒ so we have $7 \cdot 128 \cdot 176.784 \mu$ s, then 8.96 s other frequencies, then again $7 \cdot 128 \cdot 176.784 \mu$ s

⇒ together in 30 s maximal 2 sequences => maximal 0.317 s per 30 second period.

Page mode (TX-on time) / Inquiry mode (TX-on time)
