Research Scientist

Summary

Tests for compliance with FCC Regulations, Part 15, Subpart C, and for compliance with Industry Canada RSS-210, were performed on Hafele America transmitter, model WT2000L. This device is subject to Rules and Regulations as a transmitter.

In testing completed 24-May-03, the device tested in the worst case met the allowed specifications for transmitter radiated emissions by 2.2 dB (see p. 7); digital emissions, Class B, were met by 4.2 dB (see p. 7); FCC/CISPR Class B conducted were met by 0.5 dB (see p. 7).

1. Introduction

Hafele America Co model WT2000L was tested for compliance with FCC Regulations, Part 15, adopted under Docket 87-389, April 18, 1989, and with Industry Canada RSS-210, Issue 5, November, 2001. The tests were performed at the University of Michigan Radiation Laboratory Willow Run Test Range following the procedures described in ANSI C63.4-1992 "Methods of Measurement of Radio-Noise Emissions from Low-Voltage Electrical and Electronic Equipment in the Range of 9 kHz to 40 GHz". The Site description and attenuation characteristics of the Open Site facility are on file with FCC Laboratory, Columbia, Maryland (FCC Reg. No: 91050) and with Industry Canada, Ottawa, ON (File Ref. No: IC 2057).

2. Test Procedures and Equipment Used

The pertinent test equipment commonly used in our facility for measurements is listed in Table 2.1 below. The middle column identifies the specific equipment used in these tests.

Table 2.1 Test Equipment.

Test Instrument	Eqpt. Used	Manufacturer/Model
Spectrum Analyzer (0.1-1500 MHz)		Hewlett-Packard, 182T/8558B
Spectrum Analyzer (9kHz-22GHz)	X	Hewlett-Packard 8593A SN: 3107A01358
Spectrum Analyzer (9kHz-26GHz)	X	Hewlett-Packard 8593E, SN: 3412A01131
Spectrum Analyzer (9kHz-26GHz)		Hewlett-Packard 8563E, SN: 3310A01174

Ridge-horn Antenna (300-5000 MHz)	X	University of Michigan
Amplifier (5-1000 MHz)	X	Avantek, A11-1, A25-1S
Amplifier (5-4500 MHz)	X	Avantek
Amplifier (4.5-13 GHz)		Avantek, AFT-12665
Amplifier (6-16 GHz)		Trek
Amplifier (16-26 GHz)		Avantek
LISN Box		University of Michigan
Signal Generator		Hewlett-Packard 8657B

3. Configurations and Identification of Device Under Test

The DUT is a wall mounted RFID system. This system consists of a T/R module (including coupling coil antenna) and a "passive" transponder imbedded in a special key/card. The transponder in the key is considered passive because it uses the energy supplied by the transmitter coil to operate its micro and, hence, is not subject to the regulations. A multi-wire harness, power supply, and control box was used in testing. Power is supplied by a switching power supply provided by the manufacturer.

The DUT was designed and manufactured by Hafele America Co. It is identified as:

Hafele America Co Transmitter
Model: WT2000L
FCC ID: PW3111
CANADA: 4645A-111

3.1 EMI Relevant Modifications

No EMI Relevant Modifications were performed by this test laboratory.

4. Emission Limits

4.1 Radiated Emission Limits

The DUT tested falls under the category of an Intentional Radiators and the Digital Devices, subject to Subpart C, Section 15.209; and Subpart B, Section 15.109 (transmitter generated signals excluded); and Subpart A, Section 15.33. The applicable testing frequencies with corresponding emission limits are given in Tables 4.1 through 4.3 below. The DUT is also subject to the rules as a digital device.

Table 4.1. Radiated Emission Limits (TX) (FCC: 15.225; IC: RSS-210 (6.2.2 (e)))

Frequency (MHz)	Fundamental (μ V/m)
13.553-13.567	FCC: 10,000, 30m IC: 15,500, 30m

Table 4.2. Radiated Emission Limits (TX) (FCC: 15.209, 15.35; IC: RSS-210 (6.2.2(r), 6.3)).

Frequency (MHz)	Spurious* (μ V/m)
0.009 - 0.490	2400/F(kHz), 300m
0.490 - 1.705	24,000/F(kHz), 30m
1.705 - 30.0	30, 30m
30 - 88	100, 3m
88 - 216	150, 3m
216 - 960	200, 3m
Above 960	500, 3m

* Harmonics must be below the fundamental emission.

Note: (1) IC limits on higher order harmonics are equal to or greater than those set forth by the FCC guidelines. Thus, harmonics that comply with the limits set forth in Table 4.2 will inherently comply with the higher order harmonics limits for this DUT stated in IC: RSS-210 6.2.2 (e).
(2) For extrapolation to other distances, see Section 6.6.

Table 4.3. Radiated Emission Limits (FCC: 15.33, 15.35, 15.109; IC: RSS-210, 6.2.2(r)).
(Digital Class B)

Freq. (MHz)	E _{lim} (3m) μ V/m	E _{lim} dB(μ V/m)
30-88	100	40.0
88-216	150	43.5
216-960	200	46.0
960-2000	500	54.0

Note: Average readings apply above 1000 MHz (1 MHz BW)
Quasi-Peak readings apply to 1000 MHz (120 kHz BW)

4.2 Conductive Emission Limits

Table 4.4 Conducted Emission Limits (FCC:15.107 (CISPR); IC: RSS-210, 6.6).

Frequency MHz	Class A (dB μ V)		Class B (dB μ V)	
	Quasi-peak	Average	Quasi-peak	Average
.150 - 0.50	79	66	66 - 56*	56 - 46*
0.50 - 5	73	60	56	46
5 - 30	73	60	60	50

Notes:

1. The lower limit shall apply at the transition frequency
2. The limit decreases linearly with the logarithm of the frequency in the range
0.15-0.50 MHz:

*Class B Quasi-peak: dB μ V = 50.25 - 19.12*log(f)

*Class B Average: dB μ V = 40.25 - 19.12*log(f)

3. 9 kHz RBW

5. Radiated Emission Tests and Results

5.1 Anechoic Chamber Measurements

To become familiar with the radiated emission behavior of the DUT, the DUT was first studied and measured in a shielded anechoic chamber. In the chamber there is a set-up similar to that of an outdoor 3-meter site, with a turntable, an antenna mast, and a ground plane. Instrumentation includes spectrum analyzers and other equipment as needed. In this case, the receiving antenna was an active loop, placed on a tripod, approximately 1.5 meters above ground.

The DUT was laid on the test table as seen in the Attachment-Test Setup Photos. Using the loop antenna we studied emissions up to 2 MHz. The spectrum analyzer resolution and video bandwidths were usually set to 1 kHz, and sometimes to 300 Hz. Emissions were studied with the plane of the loop perpendicular and parallel to the direction of propagation from the DUT. In the chamber we also recorded the spectrum and modulation characteristics of the carrier. These data are presented in subsequent sections

5.2 Outdoor Measurements

After the chamber measurements, the emissions on our outdoor 3-meter site were measured. For transmitter emissions a loop antenna was used; the resolution bandwidth was usually 1 kHz. See Appendix for measurement set-up. For digital emissions bicone and dipole antennas were used. See Section 6.6 for field extrapolation of transmitter data from 3 m to 30 m.

5.3 Computations and Results

To convert the dBm measured on the spectrum analyzer to dB(μ V/m), we use expression

$$E_3(\text{dB}\mu\text{V/m}) = 107 + P_R + K_A - K_G + K_E$$

where P_R = power recorded on spectrum analyzer, dB, measured at 3 m
 K_A = antenna factor, dB/m
 K_G = pre-amplifier gain, including cable loss, dB
 K_E = pulse operation correction factor, dB (see 6.1)

When presenting the data, at each frequency the highest measured emission under all of the possible orientations is given. Computations and results are given in Table 5.1. There we see that as a transmitter, the DUT meets the limit by 2.2 dB. The digital emissions, Class B, were met by 4.2 dB.

6. Other Measurements and Computations

6.1 Correction For Pulse Operation

Under normal operation the transmitter is continuously polling. When the key/card is placed within reading distance of the DUT, the amplitude and duty cycle of the device decreases. See Figure 6.1. For 13 MHz operation under FCC Part 15.225 (IC RSS-210, 6.2.2(e)), averaging does not apply and QP detection is used.

6.2 Emission Spectrum

Using the loop antenna, the emission spectrum was recorded and is shown in Figure 6.2.

6.3 Bandwidth of the Emission Spectrum

The measured spectrum of the signal is shown in Figure 6.3. From the plot we see that the -20 dB bandwidth is 36.3 kHz.

6.4 Effect of Supply Voltage Variation

For this test, the relative power radiated and frequency of emission was measured at the fundamental as the voltage was varied from 90 to 140 volts. The emission variation is shown in Figure 6.4.

6.5 Input Voltage and Current

$$V = 120 \text{ VAC}$$

$$I = 60 \text{ mA (pulsed emission)}$$

6.6 Field Behavior at 13 MHz

Because at the specified 30 m measurement distance the signal is too small to measure, measurements were made at 3 m. To translate the limits from the 30 m distance to the 3 m, we computed the field behavior for a Hertzian (small loop) dipole using equations found in most antenna books. The applicable results that we need are:

<u>Freq (MHz)</u>	<u>Loop Orientation</u>	<u>3m/30m difference (dB)</u>
13.0	Coaxial, Vertical	43.91 dB
13.0	Coplanar, Vertical	22.50 dB
13.0	Coplanar, Horizontal	22.50 dB
26.0	Coaxial, Vertical	41.37 dB
26.0	Coplanar, Vertical	18.86 dB
26.0	Coplanar, Horizontal	18.86 dB

In Table 5.1 at 13 and 27 MHz, the 30m measured field strength is decreased by the dB values given above to obtain equivalent limits at 3m.
