Subject: RF MPE EXPOSURE
Re: FCC ID: PWO460021

To Whom It May Concern:

The MPE calculations for model 460021 signal booster were done for each frequency band: 1700/2100 MHz, 800 MHz, 700 MHz Band 13, 700 MHz Band 12, and 1900 MHz. For each band two calculations were done; these included the worst case scenario for each of the different types of antennas that may be connected to this signal booster: outside and inside antennas. The order of the attached calculations is as follows:

1700/2100 MHz band:

1. Outside Antenna: 314453-40075
2. Inside Antenna: 311155

800 MHz band:

1. Outside Antenna: 311129-400100
2. Inside Antenna: 311155

700 MHz Band 13:

1. Outside Antenna: 314411-40075
2. Inside Antenna: 311155

700 MHz Band 12:

1. Outside Antenna: 314411-40075
2. Inside Antenna: 311155

1900 MHz band:

1. Outside Antenna: 311129
2. Inside Antenna: 311155

A booster's uplink power must not exceed 1 watt equivalent isotropic radiated power (EIRP) for each band of operation. Composite downlink power must not exceed 0.05 watt EIRP for each band of operation (20.21(e)(8)(i)(D)). The following formula was used to calculate the equivalent isotropic radiated power:

$$\text{EIRP} = \text{Power Out (Watts)} * \text{Duty Cycle Percent} * \text{Antenna Gain (non-log)} * \text{Coax loss (non-log)}$$

The power density (mW/cm²) is calculated using the following formula:

$$\text{Calculated Power Density} = 1000 * \text{EIRP (Watts)} / (4 * \pi * (\text{Distance from Antenna (cm)}^2))$$

Sincerely,
