1. Authorized Frequency Band

Test Requirement(s):	§20.21(e)(3)	Test Engineer(s):	Hoosam B.
Test Results:	Pass	Test Date(s):	Nov/14/2018

Test Procedures: As required by 47 CFR §20.21(e)(3), Authorized frequency band measurements were made at the RF output terminals of the EUT.

The EUT was connected through an attenuator to a Spectrum Analyzer. A signal generator was used for the input to the EUT to provide a CW signal tuned to the center channel of each uplink and downlink operational band. Measurements were made at the low and high channels of each uplink and downlink frequency band.

5. Conducted Spurious Emissions

Test Requirement(s):	§2.1051	Test Engineer(s):	Keith T.
Test Results:	Pass	Test Date(s):	Nov/26/2018

Test Procedures: As required by 47 CFR §2.1051, Spurious emissions measurements were made at antenna terminals in accordance with the procedures of the KDB 935210 D03.

The EUT was connected through an attenuator to a spectrum analyzer. A signal generator was used at the input of the EUT to produce a 4.1MHz AWGN signal at the center of each CMRS operating band. Measurements were made at the low and high frequency of the uplink and downlink operational band. The required minimum resolution bandwidth was used as stated by different rule part (i.e. Part 22, 27, 24 etc.)

Table 14 – Conducted Spurious Emission Data – Downlink Summary

Per FCC § 27.53 (C) for frequency operating in 746 – 758MHz and 776-788MHz band following additional requirements apply

As per § 27.53 (C)(4) On all frequencies between 763-775MHz and 793-895MHz, by a factor not less than $65 + 10\log(P)$ dB in a 6.25kHz band segment, for mobile and portable stations.

BW correction for 6.25kHz to 10kHz RBW is following

BW correction factor = $10\log B1/B2$

Therefore BW correction factor = $10\log 6.25/10 = -2.04$

Table 16 – Conducted Spurious Emission Data – 746-757MHz Downlink Band Summary

Per FCC § 27.53 (f) for frequency operating in 746 – 763MHz and 775-793MHz emissions in the band 1559-1610MHz shall be limited to -70dBW/MHz equivalent isotropically radiated power (EIRP) for wideband signals, and -80dBW EIRP for discrete emissions of less than 700Hz bandwidth.

Since the limit is in EIRP, the MSCL (Cable Loss) information supplied by manufacturer is added along with the bandwidth correction factor.

BW correction for 700Hz to 10kHz RBW is following

BW correction factor = $10\log B1/B2$

Therefore BW correction factor = $10\log 700/1000 = -11.55$

9. Oscillation Detection

Test Requirement(s):	§20.21(e)(8)(ii)(A)	Test Engineer(s):	Hoosam B.
Test Results:	Pass	Test Date(s):	Nov/29/2018

Test Procedures: As required by 47 §20.21(e)(8)(ii)(A), Oscillation detection measurement were made at the RF antenna output terminals of the EUT.

The EUT output was connected to the spectrum analyzer through a 30dB coupled directional coupler. The measurements were made as per procedure defined in KDB 935210 D03 §7.11.

10. Radiated Spurious Emissions

Test Requirement(s):	§2.1053	Test Engineer(s):	Keith T.
Test Results:	Pass	Test Date(s):	Dec/05/2018

Test Procedures: As required by 47 §2.1053, Radiated Spurious Emissions measurement were made in accordance with the procedures of TIA-603 and KDB 935210 D03 §7.12.

The EUT was placed on a wooden table inside a 3 meter semi-anechoic room. The EUT was transmitting into a 50Ω non-radiating load which was directly connected to the EUT antenna port as shown in figure 4.

The measurement antenna was placed at a distance of 3 meters from the EUT. During the tests, the antenna height and polarization as well as EUT azimuth were varied in order to identify the maximum level of emissions from the EUT. The test was performed by placing the EUT on 3 orthogonal axis. The frequency range up to the 10th harmonic was investigated.

Spurious attenuation limit in dB = $P_1 - (43 + 10 \log_{10} (P_2)) = -13\text{dBm}$

Where P_1 = Transmitter Power in dBm and P_2 = Power in Watt
