ADMINISTRATIVE INFORMATION

PURPOSE OF TEST:

To demonstrate the compliance of The IDEN Bi-Directional Amplifier Direct Connect, 814001 with the RF Exposure Requirements for mobile devices.

REPRESENTATIVE: Patrick Cook

SUMMARY OF RESULTS

VEHICLE MOUNTED ANTENNA

The Maximum Permissible Exposure (MPE) limit for the operating frequency of the evaluated device is 0.54 mW/cm^2 for General Population / Uncontrolled Exposure. The data in this report demonstrates that this device complies with the Maximum Permissible Exposure (MPE) requirements set forth in 47 CFR §2.1091, §1.1310, and OET Bulletin 65, Edition 97-01 for General Population / Uncontrolled Exposure environment at a minimum distance of 10 cm through a ground plane from the vehicle mounted antenna (operator requirement), and for General Population / Uncontrolled Exposure environment at a minimum distance of 20 cm laterally from the vehicle mounted antenna (bystander requirement).

GLASS MOUNTED ANTENNA

The Maximum Permissible Exposure (MPE) limit for the operating frequency of the evaluated device is 0.54 mW/cm^2 for General Population / Uncontrolled Exposure. The data in this report demonstrates that this device complies with the Maximum Permissible Exposure (MPE) requirements set forth in 47 CFR §2.1091, §1.1310, and OET Bulletin 65, Edition 97-01 for General Population / Uncontrolled Exposure environment at a minimum distance of 10 cm below the vehicle glass mounted antenna base (operator requirement), and for General Population / Uncontrolled Exposure environment at a minimum distance of 20 cm laterally from the vehicle mounted antenna (bystander requirement).

APPROVALS

Steve Behm, Director of Engineering Services

QUALITY ASSURANCE:

Joyce Walker, Quality Assurance Administrative Manager

TEST PERSONNEL:

Randy Clark, EMC Engineer

Mike Wilkinson, Lab Manager

Model: 301102
Serial: NA
FCC ID: NA

PERIPHERAL DEVICES

The EUT was tested with the following peripheral device(s):

Signal Generator

Manuf: HP
Model: E4437B
Serial: MY41310476
FCC ID: DoC

Preamplifier

Manuf: Mini-Circuits
Model: ZHL-42-SMA
Serial: D030204-#19
FCC ID: DoC

DRAFT

SPECIFICATIONS AND REQUIREMENTS

The following summarizes the specifications and requirements for Maximum Permissible Exposure for mobile devices applied during RF exposure evaluation.

Excerpt from 47 CFR §1.1310 Radio Frequency Radiation Exposure Limits

Table 1. - Limits for Maximum Permissible Exposure (MPE)

(A) Limits for Occupational/Controlled Exposures

Frequency Range (MHz)	Electric Field Strength (V/m)	Magnetic Field Strength (V/m)	Power Density (mW/cm ²)	Averaging Time (Minutes)
0.3-3.0	614	1.63	*(100)	6
3.0-30	1842/f	4.89/f	*(900/f ²)	6
30-300	61.4	0.163	1	6
300-1500	---	---	f/300	6
1500-100,000	---	---	5	6

(B) Limits for General Population/Uncontrolled Exposure

Frequency Range (MHz)	Electric Field Strength (V/m)	Magnetic Field Strength (V/m)	Power Density (mW/cm ²)	Averaging Time (Minutes)
0.3-1.34	614	1.63	*(100)	30
1.34-30	824/f	2.19/f	*(180/f ²)	30
30-300	27.5	0.073	0.2	30
300-1500	---	---	f/1500	30
1500-100,000	---	---	1	30

f = frequency in MHz

* = Plane-wave equivalent power density

NOTE 1 to Table 1: Occupational/controlled limits apply in situations in which persons are exposed as a consequence of their employment provided those persons are fully aware of the potential for exposure and can exercise control over their exposure. Limits for occupational/controlled exposure also apply in situations when an individual is transient through a location where occupational/controlled limits apply provided he or she is made aware of the potential for exposure.

NOTE 2 to Table 1: General population/uncontrolled exposures apply in situations in which the general public may be exposed, or in which persons that are exposed as a consequence of their employment may not be fully aware of the potential for exposure or can not exercise control over their exposure.

SUMMARY OF RF EXPOSURE CONDITIONS

Operating Frequency Range (MHz)	806 – 821 (uplink)
Rated Power Output (Watts)	3 (conducted)

MPE Limit =	$f/1500 \text{ (mW/cm}^2\text{)}$
=	$0.537 \text{ (mW/cm}^2\text{)}$

Operator Exposure Condition

	Occupational / Controlled Exposure
X	General Population / Uncontrolled Exposure

Bystander Exposure Condition

	Occupational / Controlled Exposure
X	General Population / Uncontrolled Exposure

Device and Antenna Operating Configuration

Vehicle Mounted Antenna

Antenna used for test is a magnetically mounted vehicle antenna with gain of 5.12dBi. Input AMPS signal (representative of worst case) is provided via support signal generator. Signal generator output is fed to the input of the EUT through a preamplifier when necessary to obtain the maximum output.

Glass Mounted Antenna

Antenna used for test is a glass mounted vehicle antenna with gain of 4.5dBi. Input AMPS signal (representative of worst case) is provided via support signal generator. Signal generator output is fed to the input of the EUT through a preamplifier when necessary to obtain the maximum output.

REPORT OF MEASUREMENTS

VEHICLE MOUNTED ANTENNA

The following tables show the measurements performed to determine conformity with the applicable limits for RF exposure. Measurements are performed at the center of the equipment's operating band; this allows the maximum power output through the device. The bottom row height was adjusted to 80cm above the reference ground plane due to the shielding properties of the antenna ground plane at the measurement distance. The EUT is capable of operating with either TDMA (IDEN) or AMPS modulation schemes. Preliminary investigation using both modulation schemes indicated that the worst case power density measurements were obtained using AMPS. The TDMA modulation scheme has a higher peak output, however due to the duty cycle limitations of the equipment ($\leq 12.5\%$), this modulation scheme produces a lower average power. Frequency investigated: 813.5MHz

Operator Exposure Measurements

Measurement of the operator made directly under the ground plane at a separation of 10cm from the base of the transmitting antenna.

d (m)	mW/cm ²	Limit	Result
0.1	0.00	0.54	Pass

Bystander Exposure Measurements

Measurements on point grid in mW/cm².

	A	B	C	Height
1	0.000	0.000	0.000	1.75
2	0.000	0.001	0.000	1.00
3	0.002	0.002	0.001	0.80

The spatially averaged power density is

X (m)	mW/cm ²	Limit	Result
0.2	0.00078	0.54	Pass

Evaluation was performed at the following measurement distances: 0.20m and 0.50m. The maximum power density measurements were obtained at 0.20m.

GLASS MOUNTED ANTENNA

The following tables show the measurements performed to determine conformity with the applicable limits for RF exposure. Measurements are performed at the center of the equipment's operating band; this allows the maximum power output through the device. The EUT is capable of operating with either TDMA (IDEN) or AMPS modulation schemes. Preliminary investigation using both modulation schemes indicated that the worst case power density measurements were obtained using AMPS. The TDMA modulation scheme has a higher peak output, however due to the duty cycle limitations of the equipment ($\leq 12.5\%$), this modulation scheme produces a lower average power. Frequency investigated: 813.5MHz

Operator Exposure Measurements

Measurement of the operator made directly under the ground plane at a separation of 10cm from the base of the transmitting antenna.

d (m)	mW/cm ²	Limit	Result
0.2	0.13184	0.55	Pass

Bystander Exposure Measurements

Measurements on point grid in mW/cm².

	A	B	C	Height
1	0.028	0.114	0.028	1.75
2	0.228	0.265	0.243	1.12
3	0.096	0.114	0.070	0.50

The spatially averaged power density is

X (m)	mW/cm ²	Limit	Result
0.2	0.13184	0.55	Pass

Evaluation was performed at the following measurement distances: 0.20m and 0.50m. The maximum power density measurements were obtained at 0.20m.

TEST CONFIGURATION

The EUT antenna is placed in a configuration typical of normal installation. Where antenna mounting is required, non-conductive materials are used for support structures. Where vehicle mounted antennas are used, a reference ground plane is used to simulate actual installation. Where vehicle glass mounted antennas are used, no antenna reference ground plane is used. In order to limit external interference effects, the test is performed in a semi-anechoic chamber. The EUT equipment is setup in a configuration representative of normal use. Support equipment for the measurement instruments are located outside of the chamber.

TEST PROCEDURE

To determine the spatially averaged value, local values including the maximum value are measured over a surface area of 0.35 m (width) x 1.25 m (height) perpendicular to the ground beginning at 0.50m from the ground reference plane. Preliminary investigation is performed in order to determine the orientation and height which yields the highest power density or field strength measurements. The height of the center row of local points is determined during preliminary investigation and corresponds to a location at which a local maximum exists. Where the field is reasonably uniform (within +20%), e.g., in the far-field, measurements will suffice in one location, representative of the space that is occupied by a person. Where the field is not uniform, measurements are made at a series of locations. The measurement points are uniformly spaced within the sampling area. Local values are measured at nine points within the sampling grid. The spatially averaged electric field strength along a grid of n points is calculated using:

$$E = \left[\frac{1}{n} \sum_{i=1}^n E_i^2 \right]^{\frac{1}{2}}$$

And the spatially averaged power density along a grid of n points is calculated using:

$$W = \frac{1}{n} \sum_{i=1}^n W_i$$

Assuming measurements are made in the far field, where the E and H vectors are mutually orthogonal, power density is calculated using:

$$S = \frac{E^2}{377}$$

The following diagram is an example of the grid used to perform local measurements for RF exposure evaluation over a whole-body spatial average.

**Example Grid used for
RF Exposure Measurements**

- Represents local points used for whole-body spatial averaging

DM

The following diagram is an example of the setup used for vehicle-mounted antennas. The letter X represents the test distance used for RF exposure measurements. The distance X is measured from the phase center of the transmitting antenna to the volumetric center of the measurement instrument. In order to more accurately simulate normal installation, the antenna ground plane is not bonded to the ground reference plane. The transmitting antenna is placed in the center of the antenna ground plane.
