1.3 Details of applicant

Name : SIEMENS Mobile LLC
Street : 16745 West Bernardo Dr.
City / Zip Code : San Diego, CA 92129
Country : U.S.A
Contact : Dr. Peter Nevermann
Telephone : (858) 521 3282
Tele-fax : (858) 521 3105
e-mail : peter.nevermann@icm.siemens.com

1.4 Application details

Date of receipt of application : 2002-07-15
Date of receipt test item : 2002-07-30
Date of test : 2002-07-30/31

1.5 Test item

Manufacturer : SIEMENS
Street Address : Suedstr. 9
City / Zip Code : 47475 Kamp-Lintfort
Country : Germany
Marketing Name : C56
Model No. : L55 Tuna
Serial No.(IMEI) : 001002000031497
Description : [GSM 850 / 900 PCS mobile phone](#)
FCC-ID : PWX-C56

Additional information

Frequency : 824.2MHz – 848.8MHz for GSM 850,
1850.2MHz – 1909.8MHz for PCS 1900
Type of modulation : GMSK
Number of channels : 124 for GSM-850, 299 for PCS-1900
Antenna : Embedded dual band
Power supply : Battery or charger (AC adaptor)
Output power : 31.39dBm (1.38W) maximum ERP measured in GSM-850
31.81dBm (1.52W) maximum EIRP measured in PCS-1900
Extreme vol. Limits : 3.3 VDC – 5.2 VDC
Extreme temp. Tolerance : -30 C to +50 C

1.6 Test standards

FCC Part 22, 24 / RSS133 r1

Note: All radiated measurements were made in all three orthogonal planes. The values reported are the maximum values.

2 Technical test**2.1 Summary of test results**

No deviations from the technical specification(s) were ascertained in the course of the tests Performed	
Final Verdict: (only “passed” if all single measurements are “passed”)	Passed

Technical responsibility for area of testing:

POWER OUTPUT**§ 22.913(a) / § 24.232 (b)****Summary:**

During the process of testing, the EUT was controlled via Rhode & Schwarz Universal Radio Communication tester (CMU 200) to ensure max. power transmission and proper modulation.

This paragraph contains both average, peak output powers and EIRP measurements for the EUT.(ERP for GSM-850)
In all cases, the peak output power is within the specified limits.

Method of Measurements:

The EUT was set up for the max. output power with pseudo random data modulation.

The power was measured with R&S Spectrum Analyzer ESIB 40 (peak)

These measurements were done at 3 frequencies,

824.2 MHz, 836.6 MHz and 848.8 MHz (bottom, middle and top of operational frequency range) for GSM-850

1850.2 MHz, 1880.0 MHz and 1909.8 MHz (bottom, middle and top of operational frequency range) for PCS-1900

Conducted (GSM-850)**Limits:**

Power Step	Nominal Peak Output Power	Tolerance (dB)
0	$\leq 38.45\text{dBm}$ (7W) ERP	± 2

Power Measurements:

Conducted Average power measurements are provided by SIEMENS.

Please refer to attached document: FCC_C56_conducted_power

(page 3, section 2.1, Siemens, "FCC sample 1" IMEI: 001002000031497)

Frequency (MHz)	Average Power (dBm)
824.2	32.2
836.6	31.9
848.8	31.6

Conducted (PCS-1900)**Limits:**

Power Step	Nominal Peak Output Power	Tolerance (dB)
0	$\leq 33\text{dBm}$ (1W) EIRP	± 2

Power Measurements:

Conducted Average power measurements are provided by SIEMENS.

Please refer to attached document: FCC_C56_conducted_power

(page 3, section 2.2, Siemens, "FCC sample 1" IMEI: 001002000031497)

Frequency (MHz)	Average Power (dBm)
1850.2	29.4
1880.0	29.3
1909.8	29.4

EIRP / ERP Measurements

Description: This is the test for the maximum radiated power from the EUT.

Rule Part 22.913(a) specifies that "The ERP of mobile transmitters must not exceed 7 Watts".

Rule Part 24.232(b) specifies that "Mobile/portable stations are limited to 2 watts e.i.r.p. peak power" and 24.232(c) specifies that "Peak transmit power must be measured over any interval of continuous transmission using instrumentation calibrated in terms of an rms-equivalent voltage."

Method of Measurement:

1. In an anechoic antenna test chamber, a half-wave dipole antenna for the frequency band of interest is placed at the reference centre of the chamber. An RF Signal source for the frequency band of interest is connected to the dipole with a cable that has been constructed to not interfere with the radiation pattern of the antenna. A known (measured) power (P_{in}) is applied to the input of the dipole, and the power received (P_r) at the chamber's probe antenna is recorded.
2. A "reference path loss" is established as $P_{in} + 2.1 - P_r$.
3. The EUT is substituted for the dipole at the reference centre of the chamber. The EUT is put into CW test mode and a scan is performed to obtain the radiation pattern.
4. From the radiation pattern, the co-ordinates where the maximum antenna gain occurs is identified.
5. The EUT is then put into pulse mode at its maximum power level (Power Step 0).
6. "Gated mode" power measurements are performed with the receiving antenna placed at the coordinates determined in Step 3 to determine the output power as defined in FCC Rule 24.232 (b) and (c). The "reference path loss" from Step 1 is added to this result.
7. This value is EIRP since the measurement is calibrated using a half-wave dipole antenna of known gain (2.1 dBi) and known input power (P_{in}).
8. ERP can be calculated from EIRP by subtracting the gain of the dipole, $ERP = EIRP - 2.1\text{dBi}$.

ERP (GSM-850)**§22.913(a)****Limits:**

Power Step	Burst Average ERP
0	≤38.45dBm (7W)

Power Measurements:

FREQUENCY STABILITY**§ 2.1055(a)(1)(b) / § 24.235****Method of Measurement:**

In order to measure the carrier frequency under the condition of AFC lock, it is necessary to make measurements with the EUT in a "call mode". This is accomplished with the use of a R&S CMU 200 UNIVERSAL RADIO COMMUNICATION TESTER.

1. Measure the carrier frequency at room temperature.
2. Subject the EUT to overnight soak at -30 C.
3. With the EUT, powered via nominal voltage, connected to the CMU 200 and in a simulated call on mid channel (190 for GSM 850 & 661 for PCS-1900), measure the carrier frequency. These measurements should be made within 2 minutes of powering up the EUT, to prevent significant self warming.
4. Repeat the above measurements at 10 C increments from -30 C to +50 C. Allow at least 1 1/2 hours at each temperature, unpowered, before making measurements.
5. Remeasure carrier frequency at room temperature with nominal voltage. Vary supply voltage from minimum voltage to maximum voltage, in 0.1 Volt increments remeasuring carrier frequency at each voltage. Pause at nominal voltage for 1 1/2 hours unpowered, to allow any self heating to stabilize, before continuing.
6. Subject the EUT to overnight soak at +50 C.
7. With the EUT, powered via nominal voltage, connected to the CMU 200 and in a simulated call on mid channel (190 for GSM 850 & 661 for PCS-1900), measure the carrier frequency. These measurements should be made within 2 minutes of powering up the EUT, to prevent significant self warming.
8. Repeat the above measurements at 10 C increments from +50 C to -30 C. Allow at least 1 1/2 hours at each temperature, unpowered, before making measurements.
9. At all temperature levels hold the temperature to +/- 0.5 C during the measurement procedure.

Measurement Limit:**For Hand carried battery powered equipment:**

According to the JTC standard the frequency stability of the carrier shall be accurate to within 0.1 ppm of the received frequency from the base station. This accuracy is sufficient to meet Sec. 24.235, Frequency Stability. The frequency stability shall be sufficient to ensure that the fundamental emission stays within the authorized frequency block. As this transceiver is considered "Hand carried, battery powered equipment" Section 2.1055(d)(2) applies. This requires that the lower voltage for frequency stability testing be specified by the manufacturer. This transceiver is specified to operate with an input voltage of between 3.3 VDC and 5.2 VDC, with a nominal voltage of 3.8 VDC. Operation above or below these voltage limits is prohibited by transceiver software in order to prevent improper operation as well as to protect components from overstress. These voltages represent a tolerance of -13.15 % and +36.84 %. For the purposes of measuring frequency stability these voltage limits are to be used.

For equipment powered by primary supply voltage:

According to the JTC standard the frequency stability of the carrier shall be accurate to within 0.1 ppm of the received frequency from the base station. This accuracy is sufficient to meet Sec. 24.235, Frequency Stability. The frequency stability shall be sufficient to ensure that the fundamental emission stays within the authorized frequency block.

For this EUT section 2.1055(d)(1) applies. This requires to vary primary supply voltage from 85 to 115 percent of the nominal value for other than hand carried battery equipment.

OCCUPIED BANDWIDTH**§2.1049(c)(1), §24.238(a)(b)****-20dBc BANDWIDTH (GSM-850)**

Similar to conducted emissions, occupied bandwidth measurements are only provided for selected frequencies in order to reduce the amount of submitted data. Data were taken at the extreme and mid frequencies of the GSM-850 frequency band. Table below lists the measured -20dBC occupied bandwidths. Spectrum analyzer plots are included on the following pages.

Frequency(MHz)	-20 dBc Bandwidth(kHz)
824.2MHz	272.54
836.6MHz	276.55
848.8MHz	278.55

-20dBc BANDWIDTH CHANNEL 128(GSM-850)

-20dBc BANDWIDTH CHANNEL 190(GSM-850)

-20dBc BANDWIDTH CHANNEL 251(GSM-850)

OCCUPIED BANDWIDTH**§2.1049(c)(1), §24.238(a)(b)****PCS-1900**

Occupied Bandwidth Results

Similar to conducted emissions, occupied bandwidth measurements are only provided for selected frequencies in order to reduce the amount of submitted data. Data were taken at the extreme and mid frequencies of the PCS-1900 frequency band. Table below lists the measured 99% power(-20dBc) and -26dBc occupied bandwidths. Spectrum analyzer plots are included on the following pages.

Frequency(MHz)	-20dBc BW (99% power) (kHz)	-26dBc Bandwidth (kHz)
1850.2	282.56	318.63
1880.0	282.56	316.63
1909.2	282.56	316.63

Part 24.238 (a) requires a measurement bandwidth of at least 1% of the occupied bandwidth. For 318.63 kHz, this equates to a resolution bandwidth of at least 3.5 kHz. For this testing, a resolution bandwidth 5.0 kHz was used.

-20dBc BANDWIDTH CHANNEL 512(PCS-1900)

-20dBc BANDWIDTH CHANNEL 661(PCS-1900)

-20dBc BANDWIDTH CHANNEL 810(PCS-1900)

-26dBc BANDWIDTH CHANNEL 512(PCS-1900)

-26dBc BANDWIDTH CHANNEL 661(PCS-1900)

-26dBc BANDWIDTH CHANNEL 810(PCS-1900)

MOBILE EMISSIONS IN BASE FREQUENCY**§22.917(f)**

Frequency(MHz)	Limit(dBm)
869 - 894	-80

These measurements are provided by SIEMENS.

Please refer to attached document: **FCC_C56_Noise_in_Rx**

EMISSION LIMITS TRANSMITTER**§2.1051 / §24.238****Measurement Procedure:**

The following steps outline the procedure used to measure the radiated emissions from the EUT. The site is constructed in accordance with ANSI C63.4 – 1992 requirements and is recognised by the FCC. The spectrum was scanned from 30 MHz to the 10th harmonic of the highest frequency generated within the equipment, which is the transmitted carrier that can be as high as 848.8MHz for GSM-850 & 1910 MHz for PCS-1900. The resolution bandwidth is set as outlined in Part 24.238. The spectrum was scanned with the mobile station transmitting at carrier frequencies that pertain to low, mid and high channels of the GSM-850 & PCS-1900 bands.

The final Radiated emission test procedure is as follows:

- a) The test item was placed on a 0.8 meter high non-conductive stand at a 3 meter test distance from the receive antenna.
- b) The antenna output was terminated in a 50 ohm load.
- c) A double ridged waveguide antenna was placed on an adjustable height antenna mast 3 meters from the test item for emission measurements.
- d) Detected emissions were maximized at each frequency by rotating the test item and adjusting the receive antenna height and polarization. The maximum meter reading was recorded. The radiated emission measurements of all non-harmonic and harmonics of the transmit frequency through the 10th harmonic were measured with peak detector and 1MHz bandwidth. If the harmonic could not be detected above the noise floor, the ambient level was recorded. The equivalent power into a dipole antenna was determined by the substitution method described for ERP measurements.

Measurement Limit:

Sec. 24.238 Emission Limits.

- (a) On any frequency outside a licensee's frequency block (e.g. A, D, B, etc.) within the USPCS spectrum, the power of any emission shall be attenuated below the transmitter power (P, in Watts) by at least $43 + 10 \log(P)$ dB. The specification that emissions shall be attenuated below the transmitter power (P) by at least $43 + 10 \log(P)$ dB, translates in the relevant power range (1 to 0.001 W) to -13 dBm. At 1 W the specified minimum attenuation becomes 43 dB and relative to a 30 dBm (1 W) carrier becomes a limit of -13 dBm. At 0.001 W (0 dBm) the minimum attenuation is 13 dB which again yields a limit of -13 dBm. In this way a translation of the specification from relative to absolute terms is carried out.

Measurement Results:

Radiated emissions measurements were made only at the upper, middle, and lower carrier frequencies of the GSM-850 & PCS-1900 bands. It was decided that measurements at these three carrier frequencies would be sufficient to demonstrate compliance with emissions limits because it was seen that all the significant spurs occur well outside the band and no radiation was seen from a carrier in one block of the GSM-850 & PCS-1900 band into any of the other blocks respectively. The equipment must still, however, meet emissions requirements with the carrier at all frequencies over which it is capable of operating and it is the manufacturer's responsibility to verify this.

RESULTS OF RADIATED TESTS GSM-850:

Harmonics	Tx ch-128 Freq. (MHz)	Level (dBm)	Tx ch-190 Freq. (MHz)	Level (dBm)	Tx ch-251 Freq. (MHz)	Level (dBm)

(Conducted)

§2.1049(c)(1), §24.238(a)(b)

RECEIVER RADIATED EMISSIONS**§ 2.1053 / RSS-133**

NOTE: The radiated emissions were done with different settings, using the relevant pre-amplifiers for the relevant frequency ranges. This is the reason that the graphs show different noise levels. In the range between 18GHz and 19.1GHz very short cable connections to the antenna was used to minimize the noise level.

Limits**SUBCLAUSE § 15.209**

Frequency (MHz)	Field strength (µV/m)	Measurement distance (m)
0.009 - 0.490	2400/F(kHz)	300

CONDUCTED SPURIOUS EMISSIONS**§ 2.1057 / §24.238****Measurement Procedure:**

The following steps outline the procedure used to measure the conducted emissions from the EUT.

1. Determine frequency range for measurements: From CFR 2.1057 the spectrum should be investigated from the lowest radio frequency generated in the equipment up to at least the 10th harmonic of the carrier frequency.

For the equipment under test, this equates to a frequency range of 30 MHz to 19.1 GHz, data taken from 30 MHz to 20 GHz for PCS-1900 and 30MHz – 9GHz for GSM-850.

2. Determine EUT transmit frequencies: below outlines the band edge frequencies pertinent to conducted emissions testing.

GSM-850 Transmitter

Channel	Frequency
128	824.2 MHz
190	836.6 MHz
251	848.8 MHz

PCS-1900 Transmitter

Channel	Frequency
512	1850.2 MHz
661	1880.0 MHz
810	1909.8 MHz

Measurement Limit:

Sec. 24.238 Emission Limits.

(a) On any frequency outside frequency band of the USPCS spectrum, the power of any emission shall be attenuated below the transmitter power (P, in Watts) by at least $43+10\log(P)$ dB. For all power levels +30 dBm to 0dBm, this becomes a constant specification limit of -13 dBm.

CONDUCTED SPURIOUS EMISSIONS CHANNEL 128 (GSM-850) 30MHz – 9GHz

Note: The peak above the limit line is the carrier freq. at ch-128.

CONDUCTED SPURIOUS EMISSIONS
CHANNEL 190 (GSM-850)
30MHz – 9GHz

Note: The peak above the limit line is the carrier freq. at ch-190.

CONDUCTED SPURIOUS EMISSIONS CHANNEL 251 (GSM-850) 30MHz – 9GHz

Note: The peak above the limit line is the carrier freq. at ch-251.

30MHz – 9GHz

Date: 31.JUL.2002 09:27:52

CONDUCTED SPURIOUS EMISSIONS CHANNEL 512 (PCS-1900) 30MHz – 20GHz

Note: The peak above the limit line is the carrier freq. at ch-512.

CONDUCTED SPURIOUS EMISSIONS
CHANNEL 661 (PCS-1900)
30MHz – 20GHz

Note: The peak above the limit line is the carrier freq. at ch-661.

CONDUCTED SPURIOUS EMISSIONS CHANNEL 810 (PCS-1900) 30MHz – 20GHz

Note: The peak above the limit line is the carrier freq. at ch-810.

CONDUCTED SPURIOUS EMISSIONS
Idle Mode (PCS-1900)
30MHz – 20GHz

CONDUCTED EMISSIONS

§ 15.107/207

Measured with AC/DC power adapter - DA2-3101US-(L)
