5.2.4 Intermodulation

Test Date: Sep 12, 2014 to Sep 15, 2014

Ambient Temp: 28.3°C

Humid : 61%

Atmospheric Pressure: 101kPa

Power supply: AC 120V 60Hz

Test Method: 935210 D02 Signal Boosters Certification v02r01

Test Requirement:

700MHz Lower ABC Band FCC part 27. 53

The power of any emission outside a licensee's frequency block shall be attenuated below the transmitting power (P) by at least $43 + 10 \log (P)$ dB, or -13 dBm.

700MHz Upper C Band FCC part 27. 53

The power of any emission outside a licensee's frequency block shall be attenuated below the transmitting power (P) by at least $43 + 10 \log (P)$ dB, or -13 dBm.

800MHz Band FCC part 90. 210

The power of any emission outside a licensee's frequency block shall be attenuated below the transmitting power (P) by at least $43 + 10 \log (P)$ dB, or -13 dBm.

850MHz Band FCC part 22. 917

The power of any emission outside a licensee's frequency block shall be attenuated below the transmitting power (P) by at least $43 + 10 \log (P)$ dB, or -13 dBm.

1900MHz Band FCC part 24. 238

The power of any emission outside a licensee's frequency block shall be attenuated below the transmitter power (P) by a factor of at least $43 + 10 \log (P)$ dB, or -13 dBm.

AWS-1 Band FCC part 27. 53

The power of any emission outside a licensee's frequency block shall be attenuated below the transmitter power (P) by at least $43 + 10 \log (P)$ dB, or -13 dBm.

EUT Operation: The output power of EUT be set to maximum value, the gain of EUT be set to maximum value by software through the manufacture

Test conditions: Normal conditions

Test configuration:

Figure 4: Uplink Intermodulation Configuration

Test Procedure:

Intermodulation test procedure:

- Connect the equipment as illustrated;
- Test the background noise level with all the test facilities;
- Keep one transmitting path, all other connectors shall be connected by normal power or RF leads;
- Select the attenuator to avoid the test receiver or spectrum analyzer being destroyed;
- Keep the EUT continuously transmitting in max power;
- Keep two signal generator produce two signal are same in modulation type and level;
- Measurement the 3 order intermodulated produced by the EUT(the sum of the two unwanted signal should be rated power);

- h) Correct for all losses in the RF path;
- i) Read the conducted spurious emission of the EUT antenna port. CW signal rather than typical signal is acceptable (for FM), At maximum drive level, for each modulation: one test with three tones, or two test (high, low-band edge) with two tones;
Limit usually is -13 dBm conducted;
Not need for single channel systems;
Combination of modulation types not needed;

Remark:

For the test in two signal input or intermodulation, test input signal f1 and f2 will consider as follows conditions:

- 1) EUT frequency band span and the amount of channels;
- 2) f1 is the center frequency of lower channel, f2 is the center frequency of higher channel, Δf is the channel spacing;
- 3) in lower edge test, f1 is the center frequency of lower channel, and f2 is f1 + 1 channel frequency;
- 4) in higher edge test, f2 is the center frequency of higher channel, and f1 is f2 - 1 channel frequency;
- 5) according to the amplifier characteristic, the 3rd product will be appeared when two signals input;
- 6) base the 3rd product frequency $F1=2f1-f2$ and $F2=2f2-f1$, when the f1 and f2 frequency select above:
 - a) in lower edge test, $F1=2f1-f2=2f1-(f1+\Delta f)=f1-\Delta f$
 - b) in higher edge test, $F2=2f2-f1=f2+\Delta f$
