6 Intermodulation emissions

Intermodulation								
Test path	f0 (MHz)	CW signal spacing (kHz)	Signal level	Worst conducted test level (dBm/300Hz)	Antenna Gain (dBi)	Coupling loss (dB)	ERP (dBm/10kHz)	Limit (dBm/10kHz)
DL	411.1	6.25	Pre-AGC	-17.83	0	63.85	-68.60	-30
			3dB above AGC	-16.26	0	63.85	-66.98	-30
		12.5	Pre-AGC	-16.59	0	63.85	-67.36	-30
			3dB above AGC	-15.56	0	63.85	-66.33	-30
		25	Pre-AGC	-15.05	0	63.85	-65.82	-30
			3dB above AGC	-15.21	0	63.85	-65.98	-30

Remark:

- f0 is from Out-of-band Rejection test in the report.
- As part of the system commissioning process, processional Zone Enhancer installers and field technicians measure intermodulation products and noise levels by connecting a spectrum analyzer to the output of the enhancers in the field. Since each deployment involves a unique passive distribution network, technicians are required to access the Effective Radiated Power (ERP) at the antenna by factoring in losses from passive components such as attenuators, coaxial cables, couplers and filters. Necessary adjustments are made to ensure compliance with the regulatory limits outlined below. Setting details were declared by manufacture and stated in the user manual. Therefore, the Coupling loss in engineering practice must be greater than 63.85dB to eliminate the interference.

- According to the declaration from the manufacture, the single Antenna gain should not exceed 5dBi.
- $ERP_{final} = \text{Conducted Power} + 10 \cdot \log(10\text{kHz}/300\text{Hz}) + \text{Antenna Gain} - 2.15\text{dB} - \text{Coupling Loss}$.
- The test plots are only to record the case without engineering practice for reference.

8 Noise

Noise						
Noise within the passband						
Test path	Frequency range (MHz)	Worst conducted test level (dBm/10kHz)	Antenna Gain (dBi)	Coupling loss (dB)	ERP (dBm/10kHz)	Limit (dBm/10kHz)
DL	406.1-420	-30.96	0	63.85	-96.96	-43
Noise outside of the passband						
Test path	Frequency range (MHz)	Worst conducted test level (dBm/10kHz)	Antenna Gain (dBi)	Coupling loss (dB)	ERP (dBm/10kHz)	Limit (dBm/10kHz)
DL	0.009-405.1	-47.51	0	63.85	-113.51	-70
	421-4200	-40.08	0	63.85	-106.08	-70

Remark:

- As part of the system commissioning process, processional Zone Enhancer installers and field technicians measure intermodulation products and noise levels by connecting a spectrum analyzer to the output of the enhancers in the field. Since each deployment involves a unique passive distribution network, technicians are required to access the Effective Radiated Power (ERP) at the antenna by factoring in losses from passive components such as attenuators, coaxial cables, couplers and filters. Necessary adjustments are made to ensure compliance with the regulatory limits outlined below. Setting details were declared by manufacture and stated in the user manual. Therefore, the Coupling loss in engineering practice must be greater than 63.85dB to eliminate the interference.

- According to the declaration from the manufacture, the single Antenna gain should not exceed 5dBi.
- $ERP_{final} = \text{Conducted Power} + \text{Antenna Gain} - 2.15\text{dB} - \text{Coupling Loss}$.
- The test plots are only to record the case without engineering practice for reference.
