SAR Test Report: T62u (PXITR-502-A2)

Supplement A: Results for body-worn usage

Date of test: May 24 and 30, 2002

Laboratory: SAR Testing Laboratory
Sony Ericsson Mobile Communications, Inc.
7001 Development Drive, P.O. Box 13969,
Research Triangle Park, NC, 27709, USA

Tested by: William Stewart
Development Engineer, Antenna Development Group

Test Responsible: Dulce Altabella
Staff Engineer, Antenna Development Group

Accreditation: This laboratory is accredited to ISO/IEC 17025-1999 to perform the following electromagnetic tests: Specific Absorption Rate (SAR), dielectric parameters, and RF power measurement on the following types of products: Wireless communications devices.

A2LA certificate Number: 1650-01

Statement of Compliance: Sony Ericsson Mobile Communications, Inc. declares under its sole responsibility that the product

T62u
FCC ID: PXITR-502-A2

to which this declaration relates, is in conformity with the appropriate RF exposure standards, recommendations and guidelines. It also declares that the product was tested using specifications that closely conform to the latest appropriate measurement standards, guidelines and recommended practices. Any deviations from these specifications or from ISO/IEC 17025-1999 are noted below:

None

1. Introduction

This report is a supplement to the document SEM/CV/P-02:0591/REP "SAR Test Report: T62u (PXITR-502-A2)." The main document demonstrates compliance of the T62u wireless handset with RF safety guidelines while used against the head. In this report, compliance of the T62u wireless handset with RF safety guidelines is demonstrated while the device is used in body-worn configurations. The applicable RF safety guidelines and the SAR measurement specifications used for the test are described in [1].

4. Electrical parameters of the tissue simulating liquid

Prior to conducting SAR measurements, the relative permittivity, ϵ_r , and the conductivity, σ , of the tissue simulating liquids were measured with the dielectric probe kit. These are tabulated below. A mass density of $\rho = 1.00 \text{ g/cm}^3$ was entered into the DASY3 program in all cases. The temperatures of the tissue simulants during measurements are also given. During the tests, the ambient temperature of the laboratory was in the range 22.5 – 23.7 °C, the relative humidity was 32.3 – 38.3% and the liquid depth was above 15 cm for all the tests. It can be seen that the measured parameters are within tolerance of the recommended limits [1].

f (MHz)	Tissue type	Date	Dielectric Parameters		Simulant Temp (°C)
			ϵ_r	σ (S/m)

5. System accuracy verification

A system accuracy verification of the DASY3 was performed using the dipole validation kits listed in Section 3.1. System verification tests were conducted on the same day as the measurement of the DUT. The obtained results are displayed in the table below (SAR values are scaled to 1 Watt power delivered to the antenna). During the tests, the ambient temperature of the laboratory was in the range 22.7– 23.6 °C, the relative humidity was 32.1 – 38.3% and the liquid depth was above 15 cm for all the tests. It is seen that the system is operating within its specification, as the results are within acceptable tolerance of the reference values. Reference values are taken from numerical simulations for both the 835MHz and 1900MHz body simulant [5]. The SAR distributions are shown in Appendix 1.

Daily, prior to conducting tests, measurements were made with RF sources powered off to determine system noise. The highest system noise value was 0.000 W/kg, which is below the recommended limit [2].

f MHz	Tissue type	Measured / Reference	SAR (W/kg) 1 g/10 g	Dielectric Parameters		Simulant Temp. (°C)
				ϵ_r	σ (S/m)	
835	Body	Measured, - 05/24/02	9.62 / 6.32	55.90	0.97	22.9
		Reference (Simulation)	9.90 / 6.46	55.2	0.97	+/-2.0 of value in §4
1900	Body	Measured, 05/30/02	41.90 / 22.20	52.74	1.55	22.9
		Reference (Simulation)	40.50 / 20.89	53.3	1.52	+/-2.0 of value in §4

6. Test results

The measured 1- and 10-gram averaged SAR values of the device against the body, using battery BKB-193-1051 (800mAh) is presented in Tables 1 and 2. For body worn measurements, the device was tested against a flat phantom, representing the user's body, using carry accessory SXX 109 4705 and hands free accessory RLF-501-25/03. For AMPS, TDMA1900 and GSM1900 modes, the device was tested at the lowest, middle, and highest frequencies of the transmit band. For 800 TDMA and 800 GSM modes, the maximum power is significantly lower than that of AMPS mode, therefore SAR values are also lower and not included. Also shown are the measured conducted output powers and the temperature of the tissue simulant during the test. The depth of the tissue simulating liquid was at least 15 cm for all the cases. The humidity and ambient temperature of the test facility were in the ranges 30.3 – 43.8% and 22.8 – 24.3°C respectively. During the SAR measurements, test commands were used to control the device in the AMPS and TDMA1900 modes, and a base station simulator was used to control the device in the GSM1900 mode.

SAM 1031(R) Phantom; Flat Section; Position: (83°,270°); Frequency: 1850 MHz

Probe: ET3DV6 - SN1583; ConvF(4.91,4.91,4.91); Crest factor: 8.0; Body 1900 MHz: $\sigma = 1.55 \text{ mho/m}$ $\epsilon_r = 52.7$ $\rho = 1.00 \text{ g/cm}^3$

Cube 5x5x7: SAR (1g): 0.393 mW/g, SAR (10g): 0.222 mW/g, (Worst-case extrapolation)

Cube 5x5x7: Dx = 8.0, Dy = 8.0, Dz = 5.0

; Measured date: 05/30/02

FCC body T62u GSM1900_MZVQ_CH512_BB01

SN:UA2020MZVQ

Holster: SXX 109 4705

PHF: RLF 501 25/03

Battery: BKB 193 1051

SAR Extrapolation to the phantom inner surface. Measured for maximum SAR in 1900 GSM band, while phone is against the body using carry accessory SXX 109 4705 and hands free accessory RLF 501 25/03
