

***Electromagnetic Emissions Test Report
and
Application for Grant of Equipment Authorization
pursuant to
Industry Canada RSS-Gen Issue 1 / RSS 210 Issue 6
FCC Part 15, Subpart C Section 15.247(DTS)
on the
Netgear
Transmitter
Model: WNCRDBSB***

FCC ID: PY306200045

GRANTEE: Netgear
4500 Great America Parkway
Santa Clara, CA 95054

TEST SITE: Elliott Laboratories, Inc.
41039 Boyce Road
Fremont, CA 94538

REPORT DATE: April 28, 2006

FINAL TEST DATE: April 25 and April 26, 2006

AUTHORIZED SIGNATORY: 
Juan Martinez
Senior EMC Engineer

2016-01

Elliott Laboratories, Inc. is accredited by the A2LA, certificate number 2016-01, to perform the test(s) listed in this report. This report shall not be reproduced, except in its entirety, without the written approval of Elliott Laboratories, Inc.

Equipment Name and Model:

Transceiver, WNCRDBSB

Manufacturer:

Netgear
4500 Great America Parkway
Santa Clara, CA 95054

Tested to applicable standard:

Industry Canada RSS-Gen Issue 1
RSS 210 Issue 6 "Low-power Licence-exempt Radiocommunication Devices (All
Frequency Bands): Category I Equipment"

Test Report Prepared For:

Mark Gandler
Netgear
4500 Great America Parkway
Santa Clara, CA 95054

Measurement Facility Description Filed With Department of Industry:

Departmental Acknowledgement Number: IC4549-3 Dated March 10, 2009

Declaration of Compliance

I declare that the testing was performed or supervised by me; that the test measurements were made in accordance with the above mentioned departmental standards (through the use of ANSI C63.4: 2003 as referenced by FCC Part 15 and by section 1.0 of RSS-212, Issue 1, "Test Facilities and Test Methods for Radio Equipment" / RSS-Gen Issue 1); and that the equipment performed in accordance with the data submitted in this report.

SCOPE

An electromagnetic emissions test has been performed on the Netgear model WNCRDBSB pursuant to the following rules:

Industry Canada RSS-Gen Issue 1
RSS 210 Issue 6 "Low-power Licence-exempt Radiocommunication Devices (All Frequency Bands): Category I Equipment"
FCC Part 15, Subpart C requirements for DTS devices

Conducted and radiated emissions data has been collected, reduced, and analyzed within this report in accordance with measurement guidelines set forth in the following reference standards and as outlined in Elliott Laboratories test procedures:

ANSI C63.4:2003
RSS-212 Issue 1 Test Facilities and Test Methods for Radio Equipment

The intentional radiator above has been tested in a simulated typical installation to demonstrate compliance with the relevant Industry Canada performance and procedural standards.

Final system data was gathered in a mode that tended to maximize emissions by varying orientation of EUT, orientation of power and I/O cabling, antenna search height, and antenna polarization.

Every practical effort was made to perform an impartial test using appropriate test equipment of known calibration. All pertinent factors have been applied to reach the determination of compliance.

The test results recorded herein are based on a single type test of the Netgear model WNCRDBSB and therefore apply only to the tested sample. The sample was selected and prepared by Mark Gandler of Netgear

OBJECTIVE

The primary objective of the manufacturer is compliance with the regulations outlined in the previous section. Certification of these devices is required as a prerequisite to marketing in the US and Canada.

The primary objective of the manufacturer is compliance with the regulations outlined in the previous section. Certification of these devices is required as a prerequisite to marketing in the US. Devices categorized as Class II equipment do not require certification by Industry Canada.

Certification is a procedure where the manufacturer submits test data and technical information to a certification body and receives a certificate or grant of equipment authorization upon successful completion of the certification body's review of the submitted documents. Once the equipment authorization has been obtained, the label indicating compliance must be attached to all identical units, which are subsequently manufactured.

Maintenance of compliance is the responsibility of the manufacturer. Any modification of the product which may result in increased emissions should be checked to ensure compliance has been maintained (i.e., printed circuit board layout changes, different line filter, different power supply, harnessing or I/O cable changes, etc.).

STATEMENT OF COMPLIANCE

The tested sample of Netgear model WNCRDBSB complied with the requirements of the following regulations:

Industry Canada RSS-Gen Issue 1
RSS 210 Issue 6 "Low-power Licence-exempt Radiocommunication Devices (All Frequency Bands): Category I Equipment"
FCC Part 15, Subpart C requirements for DTS devices

Maintenance of compliance is the responsibility of the manufacturer. Any modification of the product which may result in increased emissions should be checked to ensure compliance has been maintained (i.e., printed circuit board layout changes, different line filter, different power supply, harnessing or I/O cable changes, etc.).

TEST RESULTS SUMMARY**DIGITAL TRANSMISSION SYSTEMS (2400 – 2483.5MHz)**

FCC Part 15 Reference	RSS Reference	Description	Measured Value / Comments	Limit / Requirement	Result
15.247(a)	RSS 210 A8.2	Digital Modulation	Systems uses MIMO / OFDM / DSSS techniques	-	Complies
15.247 (a) (2)	RSS 210 A8.2 (1)	6dB Bandwidth	10MHz Legacy 802.11b	>500kHz	Complies
15.247 (b) (3) Legacy 802.11b	RSS 210 A8.2 (4)	Output Power (multipoint systems)	18.7 dBm (0.073 Watts) EIRP = 0.098W ^{Note 1}	1Watt, EIRP limited to 4 Watts.	Complies
15.247(d) Legacy 802.11b	RSS 210 A8.2 (2)	Power Spectral Density	-1.2 dBm / 3kHz	8dBm/3kHz	Complies
15.247 (b) (3) Legacy 802.11g	RSS 210 A8.2 (4)	Output Power (multipoint systems)	18.5 dBm (0.07 Watts) EIRP = 0.94W ^{Note 1}	1Watt, EIRP limited to 4 Watts.	Complies
15.247(d) Legacy 802.11g	RSS 210 A8.2 (2)	Power Spectral Density	-2.4 dBm / 3kHz	8dBm/3kHz	Complies
15.247 (b) (3) MIMO 20MHz	RSS 210 A8.2 (4)	Output Power (multipoint systems)	21.1 dBm (0.130 Watts) EIRP = 0.342W ^{Note 1}	1Watt, EIRP limited to 4 Watts.	Complies
15.247(d) MIMO 20MHz	RSS 210 A8.2 (2)	Power Spectral Density	5.0 dBm / 3kHz	8dBm/3kHz	Complies
15.247 (b) (3) MIMO 40MHz	RSS 210 A8.2 (4)	Output Power (multipoint systems)	17.7 dBm (0.058 Watts) EIRP = 0.154W ^{Note 1}	1Watt, EIRP limited to 4 Watts.	Complies
15.247(d) MIMO 40MHz	RSS 210 A8.2 (2)	Power Spectral Density	-1.2 dBm / 3kHz	8dBm/3kHz	Complies
15.247(c)	RSS 210 A8.5	Antenna Port Spurious Emissions 30MHz – 25 GHz	< -30dBc	< -30dBc ^{Note 2}	Complies
15.247(c) / 15.209	RSS 210 A8.5	Radiated Spurious Emissions 30MHz – 25 GHz	53.94 dBuV/m @ 2484.8 MHz (-0.06 dB)	15.209 in restricted bands, all others <-30dBc ^{Note 2}	Complies

Note 1: EIRP calculated using antenna gain of dBi (1.2) for the highest EIRP multi-point system.

Note 2: Limit of -30dBc used because the power was measured using the UNII test procedure (maximum power averaged over a transmission burst) / RMS averaging over a time interval, as permitted under RSS 210 section A8.4(4).

GENERAL REQUIREMENTS APPLICABLE TO ALL BANDS

FCC Part 15 Section	RSS 210 Section	Description	Measured Value / Comments	Limit / Requirement	Result (margin)
15.203	-	RF Connector	Hiroshe External antenna		Complies
15.109	-	Receiver spurious emissions	N/A for FCC requirements		N/A
15.207	-	AC Conducted Emissions	49.1dB μ V @ 0.161MHz (-6.3dB)	15.207	Complies (- 6.3 dB)
15.247 (b) (5) 15.407 (f)	RSS 102	RF Exposure Requirements	Refer to MPE calculations in Exhibit 11	Refer to OET 65, FCC Part 1 and RSS 102	Complies

Note 1: Per Canada receiver emissions is required for certification. This report or application was not submitted to Canada for certification.

MEASUREMENT UNCERTAINTIES

ISO Guide 17025 requires that an estimate of the measurement uncertainties associated with the emissions test results be included in the report. The measurement uncertainties given below were calculated using the approach described in CISPR 16-4-2:2003 using a coverage factor of $k=2$, which gives a level of confidence of approximately 95%. The levels were found to be below levels of U_{cispr} and therefore no adjustment of the data for measurement uncertainty is required.

Measurement Type	Frequency Range (MHz)	Calculated Uncertainty (dB)
Conducted Emissions	0.15 to 30	± 2.4
Radiated Emissions	30 to 1000	± 3.6
Radiated Emissions	1000 to 40000	± 6.0

EQUIPMENT UNDER TEST (EUT) DETAILS**GENERAL**

The Netgear model WNCRDBSB is a RangeMax NEXT wireless CB module that is designed to provide high speed wireless internet access. Since the EUT would be placed on a table top during operation, the EUT was treated as table-top equipment during testing to simulate the end-user environment. The EUT receives its power from the host computer. The electrical rating of the Host is 120 - 240 Volts, 50/60 Hz, 1 Amps.

The sample was received on April 11, 2006 and tested on April 11, April 12, April 13 and April 21, 2006. The EUT consisted of the following component(s):

Manufacturer	Model	Description	Serial Number	FCC ID
Netgear	WNCRDBSB	RangeMax NEXT wireless CB module	-	PY306200045

ANTENNA SYSTEM

The antenna system used with the Netgear model WNCRDBSB consists of 1 pair of dipole antennas with a gain of 1.2dBi.

ENCLOSURE

The EUT does not have an enclosure as it is designed to be installed within the enclosure of a final product.

MODIFICATIONS

The EUT did not require modifications during testing in order to comply with emissions specifications.

SUPPORT EQUIPMENT

No support equipment was used during emissions testing.

EUT INTERFACE PORTS

The I/O cabling configuration during emissions testing was as follows:

Port	Connected To	Cable(s)		
		Description	Shielded or Unshielded	Length(m)
Laptop Power	AC Adapter	2 wire	Unshielded	2.0

EUT OPERATION

During MIMO testing the EUT was transmitting simultaneously on two RF chains at either the low, 2412MHZ, the middle, 2437MHz, or the high, 2462MHz in the 20MHz and 2422, 2437, and 2453 MHz in the 40MHz signaling mode.

During legacy testing the EUT was transmitting on a single chain at the low, 2412MHZ, the middle, 2437MHz, or the high, 2462MHz in either the 802.11b or 802.11g modes.

TEST SITE**GENERAL INFORMATION**

Final test measurements were taken on April 25 and April 26, 2006 at the Elliott Laboratories Open Area Test Site #Chamber 3 and 4 located at 684 West Maude Avenue, Sunnyvale, California or 41039 Boyce Road, Fremont, California Pursuant to section 2.948 of the FCC's Rules and section 3.3 of RSP-100, construction, calibration, and equipment data has been filed with the Commission.

ANSI C63.4:2003 recommends that ambient noise at the test site be at least 6 dB below the allowable limits. Ambient levels are below this requirement with the exception of predictable local TV, radio, and mobile communications traffic. The test site contains separate areas for radiated and conducted emissions testing. Considerable engineering effort has been expended to ensure that the facilities conform to all pertinent requirements of ANSI C63.4:2003 and RSS 212.

CONDUCTED EMISSIONS CONSIDERATIONS

Conducted emissions testing is performed in conformance with ANSI C63.4:2003 and RSS 212. Measurements are made with the EUT connected to the public power network through a nominal, standardized RF impedance, which is provided by a line impedance stabilization network, known as a LISN. A LISN is inserted in series with each current-carrying conductor in the EUT power cord.

RADIATED EMISSIONS CONSIDERATIONS

The FCC has determined that radiation measurements made in a shielded enclosure are not suitable for determining levels of radiated emissions. Radiated measurements are performed in an open field environment or in a semi-anechoic chamber. The test sites are maintained free of conductive objects within the CISPR defined elliptical area incorporated in ANSI C63.4:2003 guidelines and meet the Normalized Site Attenuation (NSA) requirements of ANSI C63.4:2003 / RSS 212.

MEASUREMENT INSTRUMENTATION

RECEIVER SYSTEM

An EMI receiver as specified in CISPR 16-1 is used for emissions measurements. The receivers used can measure over the frequency range of 9 kHz up to 2000 MHz. These receivers allow both ease of measurement and high accuracy to be achieved. The receivers have Peak, Average, and CISPR (Quasi-peak) detectors built into their design so no external adapters are necessary. The receiver automatically sets the required bandwidth for the CISPR detector used during measurements. If the repetition frequency of the signal being measured is below 20Hz, peak measurements are made in lieu of Quasi-Peak measurements.

For measurements above the frequency range of the receivers, a spectrum analyzer is utilized because it provides visibility of the entire spectrum along with the precision and versatility required to support engineering analysis. Average measurements above 1000MHz are performed on the spectrum analyzer using the linear-average method with a resolution bandwidth of 1 MHz and a video bandwidth of 10 Hz, unless the signal is pulsed in which case the average (or video) bandwidth of the measuring instrument is reduced to onset of pulse desensitization and then increased.

INSTRUMENT CONTROL COMPUTER

The receivers utilize either a Rohde & Schwarz EZM Spectrum Monitor/Controller or contain an internal Spectrum Monitor/Controller to view and convert the receiver measurements to the field strength at an antenna or voltage developed at the LISN measurement port, which is then compared directly with the appropriate specification limit. This provides faster, more accurate readings by performing the conversions described under Sample Calculations within the Test Procedures section of this report. Results are printed in a graphic and/or tabular format, as appropriate. A personal computer is used to record all measurements made with the receivers.

The Spectrum Monitor provides a visual display of the signal being measured. In addition, the controller or a personal computer run automated data collection programs which control the receivers. This provides added accuracy since all site correction factors, such as cable loss and antenna factors are added automatically.

LINE IMPEDANCE STABILIZATION NETWORK (LISN)

Line conducted measurements utilize a fifty microhenry Line Impedance Stabilization Network as the monitoring point. The LISN used also contains a 250 uH CISPR adapter. This network provides for calibrated radio frequency noise measurements by the design of the internal low pass and high pass filters on the EUT and measurement ports, respectively.

POWER METER

Power measurements are made using either a power meter (typically with a peak power sensor) or as detailed in FCC KDB558074 using a spectrum analyzer and either the built-in channel power measurement function or software to integrate the power over the displayed spectrum.

When using the integration method the analyzer's internal function or software account for the equivalent noise bandwidth of the resolution bandwidth used when performing the integration. The bandwidths, detector (peak or sample) and trace data (max held or power averaging) are detailed in the test data. When using a power averaging function the device is either in a continuous transmit mode or the analyzer is configured to only sweep when the transmitter is active to ensure that the averaging is performed over a transmit burst and not over quiet periods.

FILTERS/ATTENUATORS

External filters and precision attenuators are often connected between the receiving antenna or LISN and the receiver. This eliminates saturation effects and non-linear operation due to high amplitude transient events.

ANTENNAS

A biconical antenna is used to cover the range from 30 MHz to 300 MHz and a log periodic antenna is utilized from 300 MHz to 1000 MHz. Narrowband tuned dipole antennas are used over the entire 30 to 1000 MHz range for precision measurements of field strength. Above 1000 MHz, a horn antenna is used. The antenna calibration factors are included in site factors programmed into the test receivers or incorporated into the test software.

ANTENNA MAST AND EQUIPMENT TURNTABLE

The antennas used to measure the radiated electric field strength are mounted on a non-conductive antenna mast equipped with a motor-drive to vary the antenna height.

ANSI C63.4:2003 and RSS 212 specify that the test height above ground for table mounted devices shall be 80 centimeters. Floor mounted equipment shall be placed on the ground plane if the device is normally used on a conductive floor or separated from the ground plane by insulating material from 3 to 12 mm if the device is normally used on a non-conductive floor. During radiated measurements, the EUT is positioned on a motorized turntable in conformance with this requirement.

INSTRUMENT CALIBRATION

All test equipment is regularly checked to ensure that performance is maintained in accordance with the manufacturer's specifications. All antennas are calibrated at regular intervals with respect to tuned half-wave dipoles. An exhibit of this report contains the list of test equipment used and calibration information.

TEST PROCEDURES**EUT AND CABLE PLACEMENT**

The regulations require that interconnecting cables be connected to the available ports of the unit and that the placement of the unit and the attached cables simulate the worst case orientation that can be expected from a typical installation, so far as practicable. To this end, the position of the unit and associated cabling is varied within the guidelines of ANSI C63.4:2003, and the worst-case orientation is used for final measurements.

CONDUCTED EMISSIONS

Conducted emissions are measured at the plug end of the power cord supplied with the EUT. Excess power cord length is wrapped in a bundle between 30 and 40 centimeters in length near the center of the cord. Preliminary measurements are made to determine the highest amplitude emission relative to the specification limit for all the modes of operation. Placement of system components and varying of cable positions are performed in each mode. A final peak mode scan is then performed in the position and mode for which the highest emission was noted on all current carrying conductors of the power cord.

RADIATED EMISSIONS

Radiated emissions measurements are performed in two phases as well. A preliminary scan of emissions is conducted in which all significant EUT frequencies are identified with the system in a nominal configuration. At least two scans are performed from 30 MHz up to the frequency required by the regulation specified on page 1. One or more of these is with the antenna polarized vertically while the one or more of these is with the antenna polarized horizontally. During the preliminary scans, the EUT is rotated through 360°, the antenna height is varied and cable positions are varied to determine the highest emission relative to the limit. Preliminary scans may be performed in a fully anechoic chamber for the purposes of identifying the frequencies of the highest emissions from the EUT.

A speaker is provided in the receiver to aid in discriminating between EUT and ambient emissions. Other methods used during the preliminary scan for EUT emissions involve scanning with near field magnetic loops, monitoring I/O cables with RF current clamps, and cycling power to the EUT.

Final maximization is a phase in which the highest amplitude emissions identified in the spectral search are viewed while the EUT azimuth angle is varied from 0 to 360 degrees relative to the receiving antenna. The azimuth, which results in the highest emission is then maintained while varying the antenna height from one to four meters. The result is the identification of the highest amplitude for each of the highest peaks. Each recorded level is corrected in the receiver using appropriate factors for cables, connectors, antennas, and preamplifier gain. Emissions, which have values close to the specification limit may also be measured with a tuned dipole antenna to determine compliance.

Typical Test Configuration for Radiated Field Strength Measurements

The ground plane extends beyond the ellipse defined in CISPR 16 / CISPR 22 / ANSI C63.4 and is large enough to accommodate test distances (d) of 3m and 10m. Refer to the test data tables for the actual measurement distance.

Test Configuration for Radiated Field Strength Measurements
OATS- Plan and Side Views

The anechoic materials on the walls and ceiling ensure compliance with the normalized site attenuation requirements of CISPR 16 / CISPR 22 / ANSI C63.4 for an alternate test site at the measurement distances used.

Floor-standing equipment is placed on the floor with insulating supports between the unit and the ground plane.

Test Configuration for Radiated Field Strength Measurements
Semi-Anechoic Chamber, Plan and Side Views

CONDUCTED EMISSIONS FROM ANTENNA PORT

Direct measurements of power, bandwidth and power spectral density are performed with the antenna port of the EUT connected to either the power meter or spectrum analyzer via a suitable attenuator and/or filter. These are used to ensure that the front end of the measurement instrument is not overloaded by the fundamental transmission.

Test Configuration for Antenna Port Measurements

Measurement bandwidths (video and resolution) are set in accordance with the relevant standards and Elliott's test procedures for the type of radio being tested.

If a power meter is used to make output power measurements the sensor head type (peak or average) is stated in the test data table.

SPECIFICATION LIMITS AND SAMPLE CALCULATIONS

The limits for conducted emissions are given in units of microvolts, and the limits for radiated emissions are given in units of microvolts per meter at a specified test distance. Data is measured in the logarithmic form of decibels relative to one microvolt, or dB microvolts (dBuV). For radiated emissions, the measured data is converted to the field strength at the antenna in dB microvolts per meter (dBuV/m). The results are then converted to the linear forms of uV and uV/m for comparison to published specifications.

For reference, converting the specification limits from linear to decibel form is accomplished by taking the base ten logarithm, then multiplying by 20. These limits in both linear and logarithmic form are as follows:

CONDUCTED EMISSIONS SPECIFICATION LIMITS: FCC 15.207; FCC 15.107(a), RSS GEN

The table below shows the limits for the emissions on the AC power line from an intentional radiator and a receiver.

Frequency (MHz)	Average Limit (dBuV)	Quasi Peak Limit (dBuV)
0.150 to 0.500	Linear decrease on logarithmic frequency axis between 56.0 and 46.0	Linear decrease on logarithmic frequency axis between 66.0 and 56.0
0.500 to 5.000	46.0	56.0
5.000 to 30.000	50.0	60.0

OUTPUT POWER LIMITS – DIGITAL TRANSMISSION SYSTEMS

The table below shows the limits for output power and output power density. Where the signal bandwidth is less than 20 MHz the maximum output power is reduced to the power spectral density limit plus 10 times the log of the bandwidth (in MHz).

Operating Frequency (MHz)	Output Power	Power Spectral Density
902 – 928	1 Watt (30 dBm)	8 dBm/3kHz
2400 – 2483.5	1 Watt (30 dBm)	8 dBm/3kHz
5725 – 5850	1 Watt (30 dBm)	8 dBm/3kHz

The maximum permitted output power is reduced by 1dB for every dB the antenna gain exceeds 6dBi. Fixed point-to-point applications using the 5725 – 5850 MHz band are not subject to this restriction.

TRANSMIT MODE SPURIOUS RADIATED EMISSIONS LIMITS – FHSS and DTS SYSTEMS

The limits for unwanted (spurious) emissions from the transmitter falling in the restricted bands are those specified in the general limits sections of FCC Part 15 and RSS 210. All other unwanted (spurious) emissions shall be at least 20dB below the level of the highest in-band signal level (30dB if the power is measured using the sample detector/power averaging method).

SAMPLE CALCULATIONS - CONDUCTED EMISSIONS

Receiver readings are compared directly to the conducted emissions specification limit (decibel form) as follows:

$$R_T - S = M$$

where:

R_T = Receiver Reading in dBuV

S = Specification Limit in dBuV

M = Margin to Specification in +/- dB

SAMPLE CALCULATIONS - RADIATED EMISSIONS

Receiver readings are compared directly to the specification limit (decibel form). The receiver internally corrects for cable loss, preamplifier gain, and antenna factor. The calculations are in the reverse direction of the actual signal flow, thus cable loss is added and the amplifier gain is subtracted. The Antenna Factor converts the voltage at the antenna coaxial connector to the field strength at the antenna elements.

A distance factor, when used for electric field measurements above 30MHz, is calculated by using the following formula:

$$F_d = 20 * \text{LOG}_{10} (D_m/D_s)$$

where:

F_d = Distance Factor in dB

D_m = Measurement Distance in meters

D_s = Specification Distance in meters

For electric field measurements below 30MHz the extrapolation factor is either determined by making measurements at multiple distances or a theoretical value is calculated using the formula:

$$F_d = 40 * \text{LOG}_{10} (D_m/D_s)$$

Measurement Distance is the distance at which the measurements were taken and Specification Distance is the distance at which the specification limits are based. The antenna factor converts the voltage at the antenna coaxial connector to the field strength at the antenna elements.

The margin of a given emission peak relative to the limit is calculated as follows:

$$R_c = R_r + F_d$$

and

$$M = R_c - L_s$$

where:

R_r = Receiver Reading in dBuV/m

F_d = Distance Factor in dB

R_c = Corrected Reading in dBuV/m

L_s = Specification Limit in dBuV/m

M = Margin in dB Relative to Spec

SAMPLE CALCULATIONS - FIELD STRENGTH TO EIRP CONVERSION

Where the radiated electric field strength is expressed in terms of the equivalent isotropic radiated power (eirp), or where a field strength measurement of output power is made in lieu of a direct measurement, the following formula is used to convert between eirp and field strength at a distance of 3m from the equipment under test:

$$E = \frac{1000000 \sqrt{30 P}}{3} \quad \text{microvolts per meter}$$

where P is the eirp (Watts)

EUT INFORMATION

The following information was collected during the test sessions(s).

General Description

The EUT is a MIMO and legacy cardbus card that is designed to provide high speed wireless internet access. Since the EUT would be placed on a table top during operation, the EUT was treated as table-top equipment during testing to simulate the end-user environment. The EUT receives its power from the host computer system. The electrical rating of the host computer is 120 -

Equipment Under Test

Manufacturer	Model	Description	Serial Number	FCC ID
Broadcom	BCM94321CB2	MIMO cardbus	-	TBD

Other EUT Details

The Broadcom model BCM94321CB2 was considered representative of the Netgear WNCRDBSB. They are identical in all respects except for cosmetic changes necessary for rebranding.

EUT Antenna (Intentional Radiators Only)

The antenna is integral to the device.

EUT Enclosure

The EUT has no enclosure. It is designed to be installed within the enclosure of a host computer.

Modification History

Netgear	EN104	Hub	ENT4B06271953	-

Cabling and Ports

Port	Connected To	Cable(s)		
		Description	Shielded or Unshielded	Length(m)
Laptop USB	Printer	Multiwire	Shielded	1.5
Laptop Ethernet	Hub	CAT 5	Unshielded	10.0
Laptop Power	AC Adapter	2 wire	Unshielded	2.0
AC adapter	AC Mains	3 wire	Unshielded	1.5

EUT Operation During Transmitter Tests

During MIMO testing the EUT was transmitting simultaneously on two RF chains at either the low, 2412MHz, the middle, 2437MHz, or the high, 2462MHz in the 20MHz and 2422, 2437, and 2453 MHz in the 40MHz signaling mode.

During legacy testing the EUT was transmitting on a single chain at the low, 2412MHz, the middle, 2437MHz, or the high, 2462MHz in either the 802.11b or 802.11g modes.

EUT Operation During Emissions Tests

During emissions testing the EUT was transmitting at full power on channel #6, 2437MHz in either MIMO, multiple transmitters, mode or 802.11b legacy mode, single transmitter

Conducted Emissions - Power Ports

Test Specifics

Objective: The objective of this test session is to perform final qualification testing of the EUT with respect to the specification listed above.

Date of Test: 4/21/2006
Test Engineer: Juan Martinez
Test Location: SVOATS #2

Config. Used: **1**
Config Change: **None**
EUT Voltage: Refer to individual run

General Test Configuration

The EUT was located on a wooden table, 40 cm from a vertical coupling plane and 80cm from the LISN. A second LISN was used for all local support equipment.

Ambient Conditions: Temperature: **12 °C**
Rel. Humidity: **80 %**

Summary of Results

Run #	Test Performed	Limit	Result	Margin
1	CE, AC Power, 120V/60Hz	EN55022 B	Pass	49.1dBµV @ 0.161MHz (-6.3dB)
2	CE, AC Power, 120V/60Hz	EN55022 B	Pass	49.2dBµV @ 0.154MHz (-6.6dB)

Modifications Made During Testing:

No modifications were made to the EUT during testing

Deviations From The Standard

No deviations were made from the requirements of the standard.

EUT INFORMATION

General Description

The EUT is a RangeMax NEXT wireless CB module that is designed to provide high speed wireless internet access. Since the EUT would be placed on a table top during operation, the EUT was treated as table-top equipment during testing to simulate the end-user environment. The EUT receives its power from the host computer. The electrical rating of the Host is 120 - 240 Volts, 50/60 Hz, 1 Amps.

Equipment Under Test

Manufacturer	Model	Description	Serial Number	FCC ID
Netgear	WNCRDBSB	RangeMax NEXT wireless CB module	-	PY306200045

EUT Antenna

The EUT has 2Tx/Rx antennas that are automatically selected for use per the MCS index and STF mode selections. Each antenna has a gain of 1.2dBi. The antennas are external, but integral to the final product device.

EUT Enclosure

The EUT does not have an enclosure as it is designed to be installed within the enclosure of a host computer.

Spec:	FCC 15.247	Class:	N/A

RSS 210 and FCC 15.247 Antenna Port Power, Bandwidth, & Spurious Emissions (802.11g)

Test Specifics

Objective: The objective of this test session is to perform final qualification testing of the EUT with respect to the specification listed above.

Date of Test: 4/21/2006

Config. Used: 1

Test Engineer: Jmartinez

Config Change: None

Test Location: Chamber #2

EUT Voltage: 120V, 60Hz

General Test Configuration

The EUT was connected to the spectrum analyzer or power meter via a suitable attenuator. For the spurious emissions all transmit chains were connected simultaneously to the analyzer via a combiner. All other measurements were made on a single chain.

All measurements are corrected to allow for the external attenuators used.

Ambient Conditions:
Temperature: 17 °C
Rel. Humidity: 57 %

Summary of Results

Run #	Test Performed	Limit	Pass / Fail	Result / Margin
1	Output Power	15.247(b)	Pass	Refer to run
2	Power Spectral Density (PSD)	15.247(d)	Pass	Refer to run
3	6dB Bandwidth	15.247(a)	Pass	Refer to run
4	Spurious emissions	15.247(b)	Pass	Refer to run

Modifications Made During Testing:

No modifications were made to the EUT during testing

Deviations From The Standard

No deviations were made from the requirements of the standard.

EMC Test Data

Client:	Netgear	Job Number:	J63790
Model:	WNCRDBSB	T-Log Number:	T63764
Contact:	Mark Gandler	Account Manager:	Esther Zhu
Spec:	FCC 15.247	Class:	N/A

Run #1: Output Power

Transmitted signal on chain is coherent ? No

Regulatory Power Measurements:

Power -	Frequency (MHz)	Output Power (dBm) ^{Note 1}			Antenna Gain (dBi) ^{Note 3}			EIRP ^{Note 2}	
		Chain 1	Chain 2	Total	Chain 1	Chain 2	Total	dBm	W
	2412	17.4		17.4	1.2		-	18.7	0.073
	2437	18.5		18.5	1.2		-	19.7	0.094
	2457	17.0		17.0	1.2		-	18.3	0.067
	2462	16.0		16.0	1.2		-	17.3	0.053

- Note 1: Output power measured using a spectrum analyzer (see plots below):
RBW=1MHz, VB=3 MHz, sample detector, power averaging on (transmitted signal was not continuous but the ESI analyzer was configured with a gated sweep such that the analyzer was only sweeping when the device was transmitting) and power integration over 30 MHz
- Note 2: EIRP - if transmit chains are coherent then the EIRP is calculated from the sum of the antenna gains plus the total power (i.e. beam-forming is assumed because of coherency on the chains). If the individual chains are incoherent then the EIRP is calculated from the sum of the individual EIRPs for each chain.
- Note 3: If the transmit chains are coherent then the total system antenna gain is the sum of the numeric gains for each antenna. If the transmit chains are incoherent then the system antenna gain is not applicable as each transmit chain can be treated independently.

FCC 15.247 DTS - Bandedge and Spurious Emissions (802.11g)

Test Specifics

Objective: The objective of this test session is to perform final qualification testing of the EUT with respect to the specification listed above.

Date of Test: 4/25/2006
Test Engineer: Rafael Varelas
Test Location: Fremont Chamber #3

Config. Used: 1
Config Change: None
EUT Voltage: 120V/60Hz

General Test Configuration

The EUT and all local support equipment were located on the turntable for radiated spurious emissions testing. Remote equipment was located underneath the table.

For radiated emissions testing the measurement antenna was located 3 meters from the EUT.

Ambient Conditions:

Temperature:	20.2 °C
Rel. Humidity:	43 %

Summary of Results

Run #	Test Performed	Limit	Pass / Fail	Result / Margin
1	Bandedges	FCC Part 15.209 / 15.247(c)	Pass	Refer to runs
2	Radiated Spurious Emissions 1,000-26,500MHz	FCC Part 15.209 / 15.247(c)	Pass	Refer to runs

Modifications Made During Testing:

No modifications were made to the EUT during testing

Deviations From The Standard

No deviations were made from the requirements of the standard.

RSS 210 and FCC 15.247 Antenna Port Power, Bandwidth, & Spurious Emissions (802.11b)

Test Specifics

Objective: The objective of this test session is to perform final qualification testing of the EUT with respect to the specification listed above.

Date of Test: 4/21/2006

Config. Used: 1

Test Engineer: Jmartinez

Config Change: None

Test Location: Chamber #2

EUT Voltage: 120V, 60Hz

General Test Configuration

The EUT was connected to the spectrum analyzer or power meter via a suitable attenuator. For the spurious emissions all transmit chains were connected simultaneously to the analyzer via a combiner. All other measurements were made on a single chain.

All measurements are corrected to allow for the external attenuators used.

Ambient Conditions:
Temperature: 17 °C
Rel. Humidity: 57 %

Summary of Results

Run #	Test Performed	Limit	Pass / Fail	Result / Margin
1	Output Power	15.247(b)	Pass	Refer to run
2	Power Spectral Density (PSD)	15.247(d)	Pass	Refer to run
3	6dB Bandwidth	15.247(a)	Pass	Refer to run
4	Spurious emissions	15.247(b)	Pass	Refer to run

Modifications Made During Testing:

No modifications were made to the EUT during testing

Deviations From The Standard

No deviations were made from the requirements of the standard.

EMC Test Data

Client:	Netgear	Job Number:	J63790
Model:	WNCRDBSB	T-Log Number:	T63764
Contact:	Mark Gandler	Account Manager:	Esther Zhu
Spec:	FCC 15.247	Class:	N/A

Run #1: Output Power

Transmitted signal on chain is coherent ? No

Regulatory Power Measurements:

Power -	Frequency (MHz)	Output Power (dBm) ^{Note 1}			Antenna Gain (dBi) ^{Note 3}			EIRP ^{Note 2}	
		Chain 1	Chain 2	Total	Chain 1	Chain 2	Total	dBm	W
	2412	17.6		17.6	1.2		-	18.9	0.077
	2437	18.7		18.7	1.2		-	19.9	0.098
	2462	17.4		17.4	1.2		-	18.6	0.073

Note 1:	Output power measured using a spectrum analyzer (see plots below): RBW=1MHz, VB=3 MHz, sample detector, power averaging on (transmitted signal was not continuous but the ESI analyzer was configured with a gated sweep such that the analyzer was only sweeping when the device was transmitting) and power integration over 20 MHz
Note 2:	EIRP - if transmit chains are coherent then the EIRP is calculated from the sum of the antenna gains plus the total power (i.e. beam-forming is assumed because of coherency on the chains). If the individual chains are incoherent then the EIRP is calculated from the sum of the individual EIRPs for each chain.
Note 3:	If the transmit chains are coherent then the total system antenna gain is the sum of the numeric gains for each antenna. If the transmit chains are incoherent then the system antenna gain is not applicable as each transmit chain can be treated independently.

Run #3: Power Spectral Density

Power Setting	Frequency (MHz)	PSD (dBm/3kHz) ^{Note 1}			Limit dBm/3kHz	Result
		Chain 1	Chain 2	Total		
	2412	-3.5			8.0	Pass
	2437	-2.4			8.0	Pass
	2462	-2.4			8.0	Pass

Note 1: Power spectral density measured using RB=3 kHz, VB=10kHz, analyzer with peak detector and with a sweep time set to ensure a dwell time of at least 1 second per 3kHz. The measurement is made at the frequency of PSD determined from preliminary scans using RB=3kHz using multiple sweeps at a faster rate over the 6dB bandwidth of the signal.

4873.978	52.9	H	74.0	-21.1	PK	210	1.4	Restricted

Note 1: For emissions in restricted bands, the limit of 15.209 was used. For all other emissions, the limit was set 20dB below the level of the fundamental.

Note 2: Peak emission below the average limit. No average readings taken.

No emission detected 20-dB of the limit from 16 - 18 GHz and from 18 - 26.5 GHz. Measurements were performed on Chamber# 5 on April 25, 2006 by Juan Martinez

RSS 210 and FCC 15.247 Antenna Port Power, Bandwidth, & Spurious Emissions (802.11n, 20 MHz)

Test Specifics

Objective: The objective of this test session is to perform final qualification testing of the EUT with respect to the specification listed above.

Date of Test: 4/21/2006

Config. Used: 1

Test Engineer: Jmartinez

Config Change: None

Test Location: Chamber #2

EUT Voltage: 120V, 60Hz

General Test Configuration

The EUT was connected to the spectrum analyzer or power meter via a suitable attenuator. For the spurious emissions all transmit chains were connected simultaneously to the analyzer via a combiner. All other measurements were made on a single chain.

All measurements are corrected to allow for the external attenuators used.

Ambient Conditions: Temperature: 17 °C
 Rel. Humidity: 57 %

Summary of Results

Run #	Test Performed	Limit	Pass / Fail	Result / Margin
1	Output Power	15.247(b)	Pass	Refer to run
2	Power Spectral Density (PSD)	15.247(d)	Pass	Refer to run
3	6dB Bandwidth	15.247(a)	Pass	Refer to run
4	Spurious emissions	15.247(b)	Pass	Refer to run

Modifications Made During Testing:

No modifications were made to the EUT during testing

Deviations From The Standard

No deviations were made from the requirements of the standard.

EMC Test Data

Client:	Netgear	Job Number:	J63790
Model:	WNCRDBSB	T-Log Number:	T63764
Contact:	Mark Gandler	Account Manager:	Esther Zhu
Spec:	FCC 15.247	Class:	N/A

MAIN & AUX PORTS

Run #1: Output Power (MCS 0, CDD)

Transmitted signal on chain is coherent ? Yes

Regulatory Power Measurements:

Power -	Frequency (MHz)	Output Power (dBm) ^{Note 1}			Antenna Gain (dBi) ^{Note 3}			EIRP ^{Note 2}	
		Main	Aux	Total	Main	Aux	Total	dBm	W
	2412	15.3	15.4	18.4	1.2	1.2	4.2	22.6	0.181
	2417	16.7	17.0	19.8	1.2	1.2	4.2	24.1	0.254
	2437	18.0	18.2	21.1	1.2	1.2	4.2	25.3	0.342
	2462	14.8	14.9	17.9	1.2	1.2	4.2	22.1	0.161

Note 1:	Output power measured using a spectrum analyzer (see plots below): RBW=1MHz, VB=3 MHz, sample detector, power averaging on (transmitted signal was not continuous but the ESI analyzer was configured with a gated sweep such that the analyzer was only sweeping when the device was transmitting) and power integration over 30 MHz
Note 2:	EIRP - if transmit chains are coherent then the EIRP is calculated from the sum of the antenna gains plus the total power (i.e. beam-forming is assumed because of coherency on the chains). If the individual chains are incoherent then the EIRP is calculated from the sum of the individual EIRPs for each chain.
Note 3:	If the transmit chains are coherent then the total system antenna gain is the sum of the numeric gains for each antenna. If the transmit chains are incoherent then the system antenna gain is not applicable as each transmit chain can be treated independently.

Run #2: Power Spectral Density

Power Setting	Frequency (MHz)	PSD (dBm/3kHz) ^{Note 1}			Limit dBm/3kHz	Result
		Main	Aux	Total		
	2412	-3.9	-3.5	-0.7	8.0	Pass
	2437	-2.0	-3.7	0.2	8.0	Pass
	2462	-4.7	-6.5	-2.5	8.0	Pass

Note 1: Power spectral density measured using RB=3 kHz, VB=10kHz, analyzer with peak detector and with a sweep time set to ensure a dwell time of at least 1 second per 3kHz. The measurement is made at the frequency of PPSD determined from preliminary scans using RB=3kHz using multiple sweeps at a faster rate over the 6dB bandwidth of the signal.

FCC 15.247 DTS - Bandedge and Spurious Emissions (802.11n, 20MHz)

Test Specifics

Objective: The objective of this test session is to perform final qualification testing of the EUT with respect to the specification listed above.

Date of Test: 4/25/2006

Test Engineer: Rafael Varelas

Test Location: Fremont Chamber #3

Config. Used: 1

Config Change: None

EUT Voltage: 120V/60Hz

General Test Configuration

The EUT and all local support equipment were located on the turntable for radiated spurious emissions testing. Remote equipment was located underneath the table.

For radiated emissions testing the measurement antenna was located 3 meters from the EUT.

Ambient Conditions:
Temperature: 20.2 °C
Rel. Humidity: 43 %

Summary of Results

Run #	Test Performed	Limit	Pass / Fail	Result / Margin
1	Bandedges	FCC Part 15.209 / 15.247(c)	Pass	Refer to runs
2	Radiated Spurious Emissions 1,000-26,500MHz	FCC Part 15.209 / 15.247(c)	Pass	Refer to runs

Modifications Made During Testing:

No modifications were made to the EUT during testing

Deviations From The Standard

No deviations were made from the requirements of the standard.

Run #1a: Radiated Fundamental and Bandedge.

RSS 210 and FCC 15.247 Antenna Port Power, Bandwidth, & Spurious Emissions (802.11n, 40 MHz)

Test Specifics

Objective: The objective of this test session is to perform final qualification testing of the EUT with respect to the specification listed above.

Date of Test: 5/3/2006
Test Engineer: Chris Byleckie
Test Location: Fremont Chamber #4

Config. Used: 1
Config Change: None
Host Unit Voltage 120V/60Hz

General Test Configuration

The EUT was connected to the spectrum analyzer or power meter via a suitable attenuator. For the spurious emissions all transmit chains were connected simultaneously to the analyzer via a combiner. All other measurements were made on a single chain.

All measurements are corrected to allow for the external attenuators used.

Ambient Conditions:

Temperature:	24 °C
Rel. Humidity:	48 %

Summary of Results

Run #	Test Performed	Limit	Pass / Fail	Result / Margin
1	Output Power	15.247(b)	Pass	Refer to run
2	Power Spectral Density (PSD)	15.247(d)	Pass	Refer to run
3	6dB Bandwidth	15.247(a)	Pass	Refer to run
4	Spurious emissions	15.247(b)	Pass	Refer to run

Modifications Made During Testing:

No modifications were made to the EUT during testing

Deviations From The Standard

No deviations were made from the requirements of the standard.

EMC Test Data

Client:	Netgear	Job Number:	J63790
Model:	WNCRDBSB	T-Log Number:	T63764
Contact:	Mark Gandler	Account Manager:	Esther Zhu
Spec:	FCC 15.247	Class:	N/A

MAIN & AUX PORTS

Run #1: Output Power

Transmitted signal on chain is coherent ? Yes

Regulatory Power Measurements:

Power -	Frequency (MHz)	Output Power (dBm) ^{Note 1}			Antenna Gain (dBi) ^{Note 3}			EIRP ^{Note 2}	
		Main	Aux	Total	Main	Aux	Total	dBm	W
	2422	14.6	14.5	17.6	1.2	1.2	4.2	21.8	0.150
	2437	14.5	14.8	17.7	1.2	1.2	4.2	21.9	0.154
	2447	13.7	14.0	16.9	1.2	1.2	4.2	21.1	0.129
	2452	12.9	13.2	16.1	1.2	1.2	4.2	20.3	0.107

Note 1:

Output power measured using a spectrum analyzer (see plots below):
RBW=1MHz, VB=3 MHz, sample detector, power averaging on (transmitted signal was not continuous but the ESI analyzer was configured with a gated sweep such that the analyzer was only sweeping when the device was transmitting) and power integration over 50 MHz

Note 2:

EIRP - if transmit chains are coherent then the EIRP is calculated from the sum of the antenna gains plus the total power (i.e. beam-forming is assumed because of coherency on the chains). If the individual chains are incoherent then the EIRP is calculated from the sum of the individual EIRPs for each chain.

Note 3:

If the transmit chains are coherent then the total system antenna gain is the sum of the numeric gains for each antenna. If the transmit chains are incoherent then the system antenna gain is not applicable as each transmit chain can be treated independently.

Run# 2: Power Spectral Density

Power Setting	Frequency (MHz)	PSD (dBm/3kHz) ^{Note 1}			Limit dBm/3kHz	Result
		Main	Aux	Total		
	2422	-5.0	-7.9	-3.2	8.0	Pass
	2437	-7.7	-8.2	-4.9	8.0	Pass
	2452	-4.0	-4.7	-1.3	8.0	Pass

Note 1: Power spectral density measured using RB=3 kHz, VB=10kHz, analyzer with peak detector and with a sweep time set to ensure a dwell time of at least 1 second per 3kHz. The measurement is made at the frequency of PPSD determined from preliminary scans using RB=3kHz using multiple sweeps at a faster rate over the 6dB bandwidth of the signal.

RSS 210 and FCC 15.247 Radiated Spurious Emissions (802.11n, 40 MHz)

Test Specifics

Objective: The objective of this test session is to perform final qualification testing of the EUT with respect to the specification listed above.

Date of Test: 5/3/2006
Test Engineer: Chris Byleckie
Test Location: Fremont Chamber #4

Config. Used: 1
Config Change: None
Host Unit Voltage 120V/60Hz

General Test Configuration

The EUT and all local support equipment were located on the turntable for radiated spurious emissions testing. All remote support equipment was located approximately 30 meters from the EUT with all I/O connections running on top of the groundplane or routed in overhead in the GR-1089 test configuration.

For radiated emissions testing the measurement antenna was located 3 meters from the EUT.

Ambient Conditions:

Temperature:	20 °C
Rel. Humidity:	48 %

Summary of Results

Run #	Test Performed	Limit	Pass / Fail	Result / Margin
1	RE, Fundamental and Bandedge	FCC Part 15.209 / 15.247(c)	Pass	Refer to runs
2	RE, 1000 - 265000 MHz - Spurious Emissions	FCC Part 15.209 / 15.247(c)	Pass	Refer to runs

Modifications Made During Testing:

No modifications were made to the EUT during testing

Deviations From The Standard

No deviations were made from the requirements of the standard.
