**I.T.L. (PRODUCT TESTING) LTD.
FCC/IC Radio Test Report**

For

AeroScout

Equipment under test:

**WanderGuard BLUE EX5700
Controller**

**EX-5700-NA
(125kHz transmitter)**

Tested by:

M. Zohar

Approved by:

Y. Zucker

This report must not be reproduced, except in full, without the written
permission of I.T.L. (Product Testing) Ltd.

This report relates only to items tested.

Measurement/Technical Report for
AeroScout
WanderGuard BLUE EX5700 Controller

EX-5700-NA

FCC ID: Q3HEX5700
IC: 5115A-EX5700

This report concerns: Original Grant: X
 Class I Change:
 Class II Change:

Equipment type: DCD - Part 15 Low Power Transmitter Below 1705 kHz
 Low Power Transmitter General Field Limits
 (9kHz-30MHz)

Limits used: 47CFR15 Section 15.209
 RSS-Gen, Issue 4, November 2014

Measurement procedure used ANSI C.63.10 2013

Application for Certification	Applicant for this device:

1. General Information

1.1 Administrative Information

Manufacturer:	AeroScout
Manufacturer's Address:	2 Ilan Ramon St., Science Park Ness-Ziona, 7403635, Israel Tel: +972-8-936-9393 Fax: +972-8-936-5977
Manufacturer's Representative:	Leonid Shikelman
Equipment Under Test (E.U.T):	WanderGuard BLUE EX5700 Controller
Equipment Model No.:	EX-5700-NA
Equipment Part No.:	Not designated
HVIN:	EX5700-NA
PMN:	EX5700
Date of Receipt of E.U.T:	June 4, 2017
Start of Test:	June 4, 2017; July 25, 2017*
End of Test:	July 11, 2017; July 25, 2017*
Test Laboratory Location:	I.T.L (Product Testing) Ltd. 1 Bat Sheva St., LOD 7120101 ISRAEL
Test Specifications:	FCC Part 15, Subpart C, Section 15.209 RSS-Gen, Issue 4, November 2014

*Bandwidth testing was re-tested on July 25, 2017.

1.2 List of Accreditations

The EMC laboratory of I.T.L. is accredited by the following bodies:

1. The American Association for Laboratory Accreditation (A2LA) (U.S.A.), Certificate No. 1152.01.
2. The Federal Communications Commission (FCC) (U.S.A.), FCC Designation No. IL1005.
3. The Israel Ministry of the Environment (Israel), Registration No. 1104/01.
4. Industry Canada (Canada), IC File No.: 46405-4025; Sites No. IC 4025A-1, 4025A-2.

I.T.L. Product Testing Ltd. is accredited by the American Association for Laboratory Accreditation (A2LA) and the results shown in this test report have been determined in accordance with I.T.L.'s terms of accreditation unless stated otherwise in the report.

1.3 Product Description

The EX5700 Door Controller is a main component of STANLEY Healthcare's WanderGuard BLUE Wander Management Solution for monitoring and securing facility doors against resident wandering.

The WanderGuard BLUE Door Controller controls the WanderGuard BLUE system by storing all system configuration parameters and receiving messages from Tags, Keypads, and WanderGuard BLUE Manager, and locking the door as necessary. The Controller is typically installed above or in proximity to the monitored door.

Model name	WanderGuard BLUE EX5700 Door Controller
Working voltage	24-48VDC via 2 optionally types of AC/DC adapters
Mode of operation	Transceiver
Modulation	OOK
Operation Frequency Range	125kHz
Transmit power	8.8dBm
Antenna gain	N/A (Magnetic antenna)
Modulation BW	2.7Kbps

1.4 Test Methodology

Radiated testing was performed according to the procedures in ANSI C63.10: 2013. Radiated testing was performed at an antenna to EUT distance of 3 meters.

1.5 Test Facility

Emissions tests were performed at I.T.L.'s testing facility in Lod, Israel. I.T.L.'s EMC Laboratory is accredited by A2LA, certificate No. 1152.01 and its FCC Designation No. IL1005.

1.6 Measurement Uncertainty

Conducted Emission

Conducted Emission (CISPR 11, EN 55011, CISPR 22, EN 55022, ANSI C63.4)

0.15 – 30 MHz:

Expanded Uncertainty (95% Confidence, K=2):

± 3.44 dB

Radiated Emission

Radiated Emission (CISPR 11, EN 55011, CISPR 22, EN 55022, ANSI C63.4) for open site 30-1000MHz:

Expanded Uncertainty (95% Confidence, K=2):

± 4.98 dB

2. System Test Configuration

2.1 Justification

The E.U.T contains a LF 125 kHz transmitter with 2 antennas at different polarity via one RF chain.

The E.U.T has 2 installation positions: wall or ceiling mounted.

Exploratory testing was performed in 2 orthogonal polarities to determine the radiated emission “worst case”.

The results are shown in the below screening results table with the “worst case” identified as ceiling installation position.

Frequency	Wall Mounted			Ceiling Mounted		
	Field Strength	2 rd Harmonic	3 th Harmonic	Field Strength	2 rd Harmonic	3 th Harmonic
	(dBuV/m)	(dBuV/m)	(dBuV/m)	(dBuV/m)	(dBuV/m)	(dBuV/m)
125kHz	86.5	47.5	51.5	87.1	53.8	56.7

Figure 1. Screening Results

Testing was performed while the E.U.T was transmitting continuously at 125 kHz with modulation.

For AC line conducted emission testing, 2 types of AC/DC adapters were tested.

2.2 EUT Exercise Software

No special exercise software was used.

2.3 Special Accessories

2 types of AC/DC adapters was used:

Type 1: Manufacturer: MG electronics; Model No: ST242A.

Type 2: Manufacturer: ALTRONIX CORP; Model No: AL175UL.

2.4 Equipment Modifications

No equipment modifications were required to achieve compliance.

2.5 Configuration of Tested System

Figure 2. Test Set-Up

3. Conducted & Radiated Measurement Test Setup Photos

Figure 3. Conducted Emission from AC Mains (AC/DC adapter type 1) Test Setup

Figure 4. Conducted Emission from AC Mains (AC/DC adapter type 2) Test Setup

Figure 5. Radiated Emission Test Setup

4. Conducted Emission From AC Mains

4.1 Test Specification

FCC Part 15, Subpart C, Section 15.207

RSS-Gen, Issue 4: 2014, Section 8.8

4.2 Test Procedure

(Temperature (22°C)/ Humidity (57%RH))

The E.U.T operation mode and test setup are as described in Section 2 of this report. In order to minimize background noise interference, the conducted emission testing was performed inside a shielded room, with the E.U.T placed on a 0.8 meter high wooden table, 0.4 meter from the room's vertical wall. In the case of a floor-standing E.U.T., it was placed on the horizontal ground plane.

The E.U.T was powered from 115 V AC / 60 Hz via 50 Ohm / 50 μ Hn Line Impedance Stabilization Network (LISN) on the phase and neutral lines. The LISN's were grounded to the shielded room ground plane (floor), and were kept at least 0.8 meters from the nearest boundary of the E.U.T

The center of the E.U.T.'s AC cable was folded back and forth, in order to form a bundle less than 0.40 meters and a total cable length of 1 meter.

The effect of varying the position of the cables was investigated to find the configuration that produces maximum emission.

The emission voltages at the LISN's outputs were measured using a computerized receiver, complying with CISPR 16 requirements. The specification limits are loaded to the receiver and are displayed on the receiver's spectrum display.

The E.U.T was tested while transmitting simultaneously 125 kHz.

A frequency scan between 0.15 and 30 MHz was performed at 9 kHz I.F. band width, using peak detection.

The spectral components having the highest level on each line were measured using a quasi-peak and average detector.

4.3 Test Limit

Frequency of Emission (MHz)	Conducted Limit (dB μ V)	
	Quasi-peak	Average
0.15-0.5	66.0 to 56.0*	56.0 to 46.0*
0.5-5.0	56.0	46.0
5.0-30.0	60.0	50.0

* Decreases with the logarithm of the frequency.

4.4 Test Results

JUDGEMENT: Passed by 2.19 dB

The margin between the emission levels and the specification limit is, in the worst case, 5.82dB for the phase line at 0.298 MHz and 2.19dB at 0.99 MHz for the neutral line.

The EUT met the F.C.C. Part 15, Subpart C and RSS-Gen, Issue 4: 2014, Section 8.8 specification requirements.

The details of the highest emissions are given in *Figure 6* to *Figure 13*.

EMI Receiver	Rohde & Schwarz	ESCI7	100724	February 28, 2017	February 28, 2018

*Current calibration was performed on June 29, 2017 and next calibration due is June 29, 2018. This covers entire range of testing.

Figure 14 Test Equipment Used

5. Field Strength of Fundamental

5.1 Test Specification

Part 15, Subpart C, Section 15.209(a)

RSS-Gen, Issue 4: 2014, Section 8.9

5.2 Test Procedure

(Temperature (20°C)/ Humidity (46%RH))

The E.U.T. operation mode and test set-up are as described in Section 2 of this report. The E.U.T. was placed in the chamber on a non-conductive table, 0.8 meters above the ground.

The distance between the E.U.T. and test antenna was 3 meters.

The turntable and antenna polarity were adjusted for maximum level reading on the EMI receiver.

The EMI receiver was set to the E.U.T. Fundamental Frequency and Peak Detection.

5.3 Test Limit

The emissions from an intentional radiator shall not exceed the field strength levels specified in the following table:

Frequency (MHz)	Field strength (microvolts/meter)	Measurement distance (meters)	Field strength Limit (dB μ V/m)	Field strength* Limit (dB μ V/m)@3m
0.009-0.490	2400/F(kHz)	300	48.5-13.8	128.5-73.8
0.490-1.705	24000/F(kHz)	30	33.8-23.0	73.8-63.0
1.705-30.0	30	30	29.5	69.5
30-88	100	3	40.0	40.0
88-216	150	3	43.5	43.5
216-960	200	3	46.0	46.0
Above 960	500	3	54.0	54.0

*The emission limits shown in the above table are based on measurements employing a CISPR quasi-peak detector except for the frequency bands 9-90 kHz, 110-490 kHz and above 1000 MHz. Radiated emission limits in these three bands are based on measurements employing an average detector. For average radiated emission measurements above 1000 MHz, there is also a limit corresponding to 20 dB above the indicated values in the table is specified when measuring with peak detector function.

5.4 Test Results

Frequency	Pol	Peak Reading	Avg Limit	Margin
(kHz)	(V/H)	(dB μ V/m)	(dB μ V/m)	(dB)
125.0	V	101.9	105.6	-3.7
125.0	H	104.0	105.6	-1.6

Figure 15. Field Strength of Fundamental Test Results

JUDGEMENT: Passed by 1.6 dB

The EUT met the FCC Part 15, Subpart C, Section 15.209 and RSS-Gen, Issue 4: 2014, Section 8.9 requirements.

The details of the highest emissions are given in *Figure 16* to *Figure 17*.

Figure 18. Test Equipment Used

6. Radiated Emission, 9 kHz – 30 MHz

6.1 Test Specification

Part 15, Subpart C, Section 209(c)
RSS-Gen, Issue 4: 2014, Section 8.9

6.2 Test Procedure

(Temperature (22°C)/ Humidity (56%RH))

The E.U.T. operation mode and test set-up are as described in Section 2 of this report. The E.U.T. was placed in the chamber on a non-conductive table, 0.8 meters above the ground.

The distance between the E.U.T. and test antenna was 3 meters.

The turntable and antenna polarity were adjusted for maximum level reading on the EMI receiver.

The EMI receiver was set to the E.U.T. Fundamental Frequency and Peak Detection.

The frequency range 9 kHz-30 MHz was scanned.

6.3 Test Limit

The level of any unwanted emissions from an intentional radiator shall not exceed the level of the fundamental emission .in addition the emissions from an intentional radiator shall not exceed the field strength levels specified in the following table:

Frequency (MHz)	Field strength (microvolts/meter)	Measurement distance (meters)	Field strength (dBμV/m)	Field strength* (dBμV/m)@3m
0.009-0.490	2400/F(kHz)	300	48.5-13.8	128.5-73.8
0.490-1.705	24000/F(kHz)	30	33.8-23.0	73.8-63.0
1.705-30.0	30	30	29.5	69.5
30-88	100	3	40.0	40.0
88-216	150	3	43.5	43.5
216-960	200	3	46.0	46.0
Above 960	500	3	54.0	54.0

*The emission limits shown in the above table are based on measurements employing a CISPR quasi-peak detector except for the frequency bands 9-90 kHz, 110-490 kHz and above 1000 MHz. Radiated emission limits in these three bands are based on measurements employing an average detector. For average radiated emission measurements above 1000 MHz, there is also a limit corresponding to 20 dB above the indicated values in the table is specified when measuring with peak detector function.

6.4 Test Results

JUDGEMENT: Passed by 17.3 dB

The EUT met the requirements of the F.C.C. Part 15, Subpart C, Section 209 and RSS-Gen, Issue 4: 2014, Section 8.9 specification.

See additional information in *Figure 19*.

Radiated Emission 9 kHz – 30 MHz

E.U.T Description WanderGuard BLUE EX5700
Controller
Model Number EX-5700-NA
Part Number: Not designated

Specification: FCC, Part 15, Subpart C
RSS-Gen, Issue 4: 2014, Section 8.9

Antenna Polarization: Horizontal/Vertical Frequency range: 9 kHz to 30.0 MHz
Test Distance: 3 meters Detector: Peak
Operation Frequencies: 125kHz

Frequency	Polarity	Peak Reading	Limit	Margin
(kHz)	(V/H)	(dB μ V/m)	(dB μ V/m)	(dB)
250.0	V	68.7	99.6	-30.9
	H	70.8	99.6	-28.8
375.0	V	53.7	96.1	-42.4
	H	57.2	96.1	-38.9
625.0	V	51.7	71.7	-20.0
	H	54.4	71.7	-17.3

Figure 19. Radiated Emission

Margin refers to the test results obtained minus specified requirement; thus a positive number indicates failure, and a negative result indicates that the product passes the test.

6.5 Test Instrumentation Used; Radiated Measurements

Instrument	Manufacturer	Model	Serial No.	Last Calibration Date	Next Calibration Due
EMI Receiver	R&S	ESCI7	100724	February 28, 2017	February 28, 2018
Loop Antenna	EMCO	6502	2950	September 12, 2016	September 12, 2017
Semi Anechoic Chamber	ETS	S81	SL 11643	NCR	NCR

Figure 20. Test Equipment Used

6.6 Field Strength Calculation

The field strength is calculated directly by the EMI Receiver software, and a "Correction Factors" data disk, using the following equation:

$$FS = RA + AF + CF$$

FS: Field Strength [dB μ V/m]
 RA: Receiver Amplitude [dB μ V]
 AF: Receiving Antenna Correction Factor [dB/m]
 CF: Cable Attenuation Factor [dB]

Example: FS = 30.7 dB μ V (RA) + 14.0 dB/m (AF) + 0.9 dB (CF) = 45.6 dB μ V

No external pre-amplifiers are used.

7. Bandwidth for 125 kHz Transmitter

7.1 Test Specification

Part 2, Section 2.1049

RSS-Gen, Issue 4: 2014, Section 6.6

7.2 Test Procedure

(Temperature (22°C)/ Humidity (56%RH))

The E.U.T. operation mode and test set-up are as described in Section 2 of this report. The E.U.T. was placed in the chamber on a non-conductive table, 0.8 meters above the ground.

The distance between the E.U.T. and test antenna was 3 meters.

The transmitter unit was operated with normal modulation. The spectrum analyzer span was set to ~ 3 times the OBW. The spectrum bandwidth of the transmitter unit was measured and recorded.

99% OBW function was set “on”.
