SUMMARY

The equipment complies with FCC CFR 47 Part 20.

This test report contains only the results of a single test of the sample supplied for the examination.
It is not a general valid assessment of the features of the respective products of the mass-production.

* This device is not using utilizing spectrum block filtering.

2.2 Description of EUT modification

During the test, there was no mechanical or circuitry modification to improve RF and spurious characteristic, and any RF and spurious suppression device(s) was not added against the device tested.

2.3 Test configuration

• Type of peripheral equipment used

Model	Manufacturer	Description	Connected to	Remark
AVHR-5000N	OPISYS Incorporated	InVehicle Dual Band Booster	-	-
N5182A	Agilent	Signal Generator	EUT	-
N9020A	Agilent	Spectrum Analyzer	EUT	

• Type of cable used

Device from	Device to	Type of Cable	Length (m)	Shielded
EUT	Signal Generator	SMA-Type	1	Y
EUT	Spectrum Analyzer	SMA-Type	3	Y

• Mode of operation during the test

The EUT has maintained normal operation during the test.

3. Measurement data

3.1 Authorized frequency band verification

This test is intended to confirm that the Signal Booster only operates on the CMRS frequency bands authorized for use by the NPS. In addition, this test will identify the frequency at which the maximum gain is realized with each CMRS operational band, which then serves as a basis for subsequent tests.

3.1.1 Specification

- FCC 13-21
- FCC Part 20.21 (e)(3)

3.1.2 Measurement method

- 935210 D03 Wideband Consumer Signal Booster Measurement Guidance DR04-41516 §7.1
 - a) Connect the EUT to the test equipment as shown in **Set-Up**. Begin with the uplink output connected to the spectrum analyzer.
 - b) Set the spectrum analyzer RBW for 100 kHz with the VBW $\geq 3X$ the RBW using a PEAK detector with the MAX HOLD function.
 - c) Set the center frequency of the spectrum analyzer to the center of the operational band under test with a span of 1 MHz.
 - d) Set the signal generator for CW mode and tune to the center frequency of the operational band under test.
 - e) Set the initial signal generator power to a level that is at least 6 dB below the AGC level specified by the manufacturer.
 - f) Slowly increase the signal generator power level until the output signal reaches the AGC operational level.
 - g) Reduce the signal generator power to a level that is 3 dB below the level noted above and manually reset the EUT.
 - h) Reset the spectrum analyzer span to 2 times the CMRS band under test. Adjust the tuned frequency of the signal generator to sweep 2 times the CMRS band using the sweep function. Note: The AGC must not be activated throughout entire sweep.
 - i) Using three markers identify the CMRS band edges and the frequency with the highest power. Ensure that the values of all markers are visible on the display of the spectrum analyzer (e.g., marker table set to on).
 - j) Capture the spectrum analyzer trace for inclusion in the test report.
 - k) Repeat steps c) to j) for all operational uplink and downlink bands.

3.2 Maximum power measurement

3.2.1 Specification

- FCC 13-21
- FCC Part 20.21 (e)(8)(i)(B)
- FCC Part 20.21 (e)(8)(i)(D)

3.2.2 Measurement method

- 935210 D03 Wideband Consumer Signal Booster Measurement Guidance DR04-41516 §7.2
 - a) Connect the EUT to the test equipment as shown in **Set-Up**. Begin with the uplink output (donor port) connected to the spectrum analyzer.
 - b) Configure the signal generator and spectrum analyzer for operation on the frequency determined in **Frequency Band** with the highest power level, but with the center frequency of the signal no closer than 2.5 MHz from the band edge. The spectrum analyzer span shall be set to at least 10 MHz.
 - c) Set the initial signal generator power to a level well below that which causes AGC control.
 - d) Slowly increase the signal generator power level until the output signal reaches the AGC operational limit (from observation of signal behavior on the spectrum analyzer; e.g., no further increase in output power as input power is increased).
 - e) Reduce power sufficiently on the signal generator to ensure that the AGC is not controlling the power output.
 - f) Slowly increase the signal generator power to a level just below (within 0.5 dB of) the AGC limit without triggering the AGC. Note the signal generator power level as (P_{in}).
 - g) Measure the output power (P_{out}) with the spectrum analyzer as follows.
 - h) Set RBW = 100 kHz for AWGN signal type and 300 kHz for CW or GSM signal type
 - i) Set VBW $\geq$ 3X RBW
 - j) Select either the BURST POWER or CHANNEL POWER measurement tool, as required for each signal type. The channel power integration bandwidth shall be 99% occupied bandwidth (4.1 MHz).
 - k) Select the RMS (power averaging) detector.
 - l) Ensure that the number of measurement points per sweep $\geq$ (2 x span)/RBW (Note: This requirement does not apply for BURST power measurement mode).
 - m) Set sweep time = auto couple, or as necessary (but no less than auto couple value).
 - n) Trace average at least 100 traces in power averaging (i.e., RMS) mode.
 - o) Record the measured power level as P_{out} with one set of results for the GSM or CW input stimulus and another set of results for the AWGN input stimulus.
 - p) Repeat the procedure for each operational uplink and downlink frequency band supported by the booster.

3.2.3 Limit

- Uplink : Upper / 1 W (30 dBm),
- Downlink : Upper / 50 mW (17 dBm)

3.3 Maximum booster gain computation

3.3.1 Specification

- FCC 13-21
- FCC Part 20.21 (e)(8)(i)(B)
- FCC Part 20.21 (e)(8)(i)(C)(2)

3.3.2 Measurement method

- 935210 D03 Wideband Consumer Signal Booster Measurement Guidance DR04-41516 §7.3
 - a) Compute the maximum gain of the booster as follows to demonstrate compliance to the applicable gain limits as specified.
 - b) For both the uplink and downlink in each supported frequency band, use each of the P_{out} and P_{in} value pairs for all signal types used in 7.2 in the following equation to determine the maximum gain (G) of the booster: $G \text{ (dB)} = P_{out} \text{ (dBm)} - P_{in} \text{ (dBm)}$.
 - c) Record the maximum gain of the uplink and downlink paths for each supported frequency band and verify that the each gain value complies with the applicable limit.

3.3.3 Set-Up

3.3.4 Limit

- Mobile Booster maximum gain shall not exceed 50 dB when using an inside antenna.
- The uplink and downlink gain under each condition was verified to be within 9dB of each other.

- FCC Part 20.21 (e)(8)(i)(F)

3.4.2 Measurement method

- 935210 D03 Wideband Consumer Signal Booster Measurement Guidance DR04-41516 §7.4
 - a) Connect the signal booster to the test equipment as shown in **Set-Up**. Begin with the uplink output connected to the spectrum analyzer.
 - b) Set the spectrum analyzer RBW = 3 kHz.
 - c) Set the VBW $\geq 3 \times$ the RBW.
 - d) Select the RMS detector.
 - e) Set the spectrum analyzer center frequency to the center of the supported operational band under test.
 - f) Set the span to 5 MHz.
 - g) Configure the two signal generators for CW operation with generator 1 tuned 300 kHz below the operational band center frequency and generator 2 tuned 300 kHz above the operational band center frequency.
 - h) Set the signal generator amplitudes so that the power from each into the RF combiner is equivalent and turn on the RF output.
 - i) Increase the signal generators' amplitudes equally until just before the EUT begins AGC and ensure that all intermodulation products (if any exist), are below the specified limit of -19 dBm.
 - j) Utilize the trace averaging function of the spectrum analyzer and wait for the trace to stabilize. Place a marker at the highest amplitude intermodulation product.
 - k) Record the maximum intermodulation product amplitude level that is observed.
 - l) Capture the spectrum analyzer trace for inclusion in the test report.
 - m) Repeat steps e) to l) for all uplink and downlink operational bands.

Note: If using a single signal generator with dual outputs, ensure that intermodulation products are not the result of the generator.
 - n) Increase the signal generator amplitude in 2 dB steps to 10 dB above the AGC threshold determined in i) to ensure that the EUT maintains compliance with the intermodulation

3.4.3 Limit

- The transmitted intermodulation products of a consumer booster at its uplink and downlink ports shall not exceed the power level of -19 dBm with a 3 kHz measurement bandwidth for the supported bands of operation

3.5 Out of band emission

3.5.1 Specification

- FCC 13-21
- FCC Part 20.21 (e)(8)(i)(E)

3.5.2 Measurement method

- 935210 D03 Wideband Consumer Signal Booster Measurement Guidance DR04-41516 §7.5
 - a) Connect the EUT to the test equipment as shown in **Set-Up**. Begin with the uplink output connected to the spectrum analyzer.
 - b) Configure the signal generator for the appropriate operation for all uplink and downlink bands:
 - i) GSM: 0.2 MHz from upper and lower band edge
 - ii) LTE (5 MHz): 2.5 MHz from upper and lower band edge
 - iii) CDMA: 1.25 MHz from upper and lower band edge, except for cellular as follows (only the upper and lower frequencies need to be tested): 824.88 MHz, 845.73 MHz, 836.52 MHz, 848.10 MHz, 869.88 MHz, 890.73 MHz, 881.52 MHz, 893.10 MHz.

Note 1: Alternative test modulation types:

 - CDMA (alternative 1.25 MHz AWGN)
 - LTE 5 MHz (alternative W-CDMA or 4.1 MHz AWGN)

Note 2: For LTE, the signal generator should utilize the uplink and downlink signal types for these modulations in uplink and downlink tests, respectively. LTE shall use 5 MHz signal 25 resource blocks transmitting.

Note 3: AWGN is the measured 99% occupied bandwidth.
 - c) Set the signal generator amplitude to the maximum power level prior to AGC similar to the procedures in method of **Maximum power** d) to f) of power measurement procedure for appropriate modulations.
 - d) Set RBW = measurement bandwidth specified in the applicable rule section for the supported frequency band.
 - e) Set VBW = 3 X RBW.
 - f) Select the RMS (power averaging) detector.
 - g) Sweep time = auto-couple.
 - h) Set the analyzer start frequency to the upper band/block edge frequency and the stop frequency to the upper band/block edge frequency plus 100 kHz or 1 MHz, per applicable rule part.
 - i) Trace average at least 100 traces in power averaging (i.e., RMS) mode.
 - j) Use peak marker function to find the maximum power level.
 - k) Capture the spectrum analyzer trace of the power level for inclusion in the test report.
 - l) Increase the signal generator amplitude in 2 dB steps until the maximum input level indicated in 5.4 is reached. Ensure that the EUT maintains compliance with the OOB limits.
 - m) Reset the analyzer start frequency to the lower band/block edge frequency minus 100 kHz or 1 MHz, as per applicable rule part, and the stop frequency to the lower band/block edge frequency and repeat steps j) to l).
 - n) Repeat steps b) through m) for each uplink and downlink operational band.

3.5.3 Limit

- Booster out of band emissions (OOBE) shall be at least 6 dB below the FCC's mobile emission limits for the supported bands of operation.
- Out of band emissions limit = $6 + (43 + 10 \log (P)) = -19 \text{ dBm}$

3.6 Conducted spurious emission

3.6.1 Specification

- FCC Part 22.917(a)
- FCC Part 24.238(a)
- § 2.1051 Spurious emission at antenna terminals

3.6.2 Measurement method

- 935210 D03 Wideband Consumer Signal Booster Measurement Guidance DR04-41516 §7.6
 - a) Connect the EUT to the test equipment as shown in **Set-Up**. Begin with the uplink output connected to the spectrum analyzer.
 - b) Configure the signal generator for AWGN with a 99% occupied bandwidth of 4.1 MHz operation with a center frequency corresponding to the center of the CMRS band under test.
 - c) Set the signal generator amplitude to the level determined in the power measurement procedure in **Maximum power**.
 - d) Turn on the signal generator RF output and measure the spurious emission power levels with an appropriate measurement instrument as follows.
 - e) Set RBW = measurement bandwidth specified in the applicable rule section for the operational frequency band under consideration (see Annex A for relevant cross-references). Note that many of the individual rule sections permit the use of a narrower RBW (typically $\geq 1\%$ of the emission bandwidth) to enhance measurement accuracy, but the result must then be integrated over the specified measurement bandwidth.
 - f) Set VBW = 3 X RBW.
 - g) Select the power averaging (RMS) detector. (See above note regarding the use of a peak detector for preliminary measurements.)
 - h) Sweep time = auto-couple.
 - i) Set the analyzer start frequency to the lowest radio frequency signal generated in the equipment, without going below 9 kHz, and the stop frequency to the lower band/block edge frequency minus 100 kHz or 1 MHz, as specified in the applicable rule part. Note that the number of measurement points in each sweep must be $\geq (2 \times \text{span}/\text{RBW})$ which may require that the measurement range defined by the start and stop frequencies above be subdivided, depending on the available number of measurement points provided by the spectrum analyzer. Trace average at least 10 traces in power averaging (i.e., RMS) mode.
 - j) Use the peak marker function to identify the highest amplitude level over each measured frequency range. Record the frequency and amplitude and capture a plot for inclusion in the test report.
 - k) Reset the analyzer start frequency to the upper band/block edge frequency plus 100 kHz or 1 MHz, as specified in the applicable rule part, and the analyzer stop frequency to 10 times the highest frequency of the fundamental emission. Note that the number of measurement points in each sweep must be $\geq (2 \times \text{span}/\text{RBW})$ which may require that the measurement range defined by the start and stop frequencies above be subdivided, depending on the available number of measurement points provided by the spectrum analyzer.
 - l) Use the peak marker function to identify the highest amplitude level over each of the measured frequency ranges. Record the frequency and amplitude and capture a plot for inclusion in the test report.
 - m) Repeat steps b) through l) for each supported frequency band of operation.

3.6.3 Limit

- §2.1051, FCC Part 22.917(a), FCC Part 24.238(a)
Conducted emissions limit = -13 dBm
- Emissions limit = $P_1 - (43 + 10 \log (P_2)) = -13 \text{ dBm}$
 P_1 = Power in dBm
 P_2 = Power in Watts
- Booster out of band emissions (OOBE) shall be at least 6 dB below the FCC's mobile emission limits
Booster's emission limit = Mobile emission limit – 6 dB = -19 dBm

 - e) Measure the maximum transmitter noise power level.
 - f) Save the spectrum analyzer plot as necessary for inclusion in the final test report.
 - g) Repeat steps b) to f) for all operational uplink and downlink bands.
 - h) Connect the EUT to the test equipment as shown in **Set-Up 2** for uplink and **Set-Up 3** for downlink. Ensure the coupled path of the RF coupler is connected to the spectrum analyzer.
 - i) Configure the signal generator for 4.1 MHz AWGN operation for uplink test and 200 kHz 99% OBW AWGN for downlink test.
 - j) Set the spectrum analyzer RBW for 1 MHz with the VBW $\geq 3X$ the RBW with an RMS AVERAGE detector with at least 100 trace averages.
 - k) Set the center frequency of the spectrum analyzer to the center of the CMRS band under test with the span $\geq 2X$ the CMRS band. This shall include all spectrum blocks in the particular CMRS band under test (see Annex A). For uplink noise measurements, set the spectrum analyzer center frequency for the uplink band under test and tune the signal generator to the center of the paired downlink band. For downlink noise measurements, set the spectrum analyzer to the center of the downlink band and tune the signal generator to the upper or lower band-edge of the same band, ensuring that the maximum noise power is being measured.
 - l) Measure the maximum transmitter noise power level when varying the downlink signal generator level from -90 dBm to -20 dBm in 1 dB steps within the RSSI dependent region and 10 dB steps outside the RSSI dependent region, report the six values closest to the limit with at least two points within the RSSI dependent region of the limit.
 - m) Repeat g) through l) for all operational uplink and downlink bands.
 - n) Variable uplink noise timing is to be measured as follows.
 - a) Set the spectrum analyzer to the uplink frequency to be measured.
 - b) Set the span to 0 Hz with a sweep time of 10 seconds.
 - c) Set the power level of the signal generator to the lowest level of the RSSI dependent noise.
 - d) Select MAX HOLD and increase the power level of the signal generator by 10 dB for mobile boosters and 20 dB for fixed boosters.
 - e) Ensure that the uplink noise decreases to the specified level within 1 second for mobile devices and 3 seconds for fixed devices.
 - t) Repeat n) to s) for all operational uplink and downlink bands

3.8 Uplink inactivity

3.8.1 Specification

- FCC 13-21
- FCC Part 20.21 (e)(8)(i)(I)

3.8.2 Measurement method

- 935210 D03 Wideband Consumer Signal Booster Measurement Guidance DR04-41516 §7.8
 - Connect the EUT to the test equipment as shown in **Set-Up** with the uplink output connected to the spectrum analyzer.
 - Select the RMS power averaging detector.
 - Set the spectrum analyzer RBW for 1 MHz with the VBW $\geq$ 3X RBW.
 - Set the center frequency of the spectrum analyzer to the center of the uplink operational band.
 - Set the span for 0 Hz with a single sweep time for a minimum of 330 seconds.
 - Start to capture a new trace using MAX HOLD.
 - After approximately 15 seconds turn on the EUT power.
 - Once the full spectrum analyzer trace is complete place a MARKER on the leading edge of the pulse and use the DELTA MARKER METHOD to measure the time until the uplink was squelched.
 - Ensure the noise level for the squelched signal is below the uplink inactivity noise power limit, as specified by the rules.
 - Capture the plot for inclusion in the test report.
 - Measure noise using procedures in a) to e).
 - Repeat steps c) to k) for all operational uplink bands.

3.8.3 Set-Up

3.8.4 Limit

- §20.21(e), When a consumer booster is not serving an active device connection after 5 minutes the uplink noise power shall not exceed -70 dBm/MHz.

3.9 Variable booster gain

3.9.1 Specification

- FCC 13-21
- FCC Part 20.21 (e)(8)(i)(C)

3.9.2 Measurement method

- 935210 D03 Wideband Consumer Signal Booster Measurement Guidance DR04-41516 §7.9
 - a) Connect the EUT to the test equipment as shown in **Set-Up** with the uplink output connected to signal generator 1. Ensure the coupled path of the RF coupler is connected to the spectrum analyzer.
 - b) Configure downlink signal generator 1 for AWGN operation with an 99% occupied bandwidth of 4.1 MHz tuned to the center of the operational band.
 - c) Set the power level and frequency of signal generator 2 to a value 5 dB below the AGC level determined from **Maximum power**. The signal type is AWGN with a 99% OBW of 4.1 MHz.
 - d) Set RBW = 100 kHz.
 - e) Set VBW $\geq$ 300 kHz.
 - f) Select the CHANNEL POWER measurement tool.
 - g) Select the RMS (power averaging) detector.
 - h) Ensure that the number of measurement points per sweep $\geq (2 \times \text{span})/\text{RBW}$.
 - i) Sweep time = auto couple or as necessary (but no less than auto couple value).
 - j) Trace average at least 10 traces in power averaging (i.e., RMS) mode.
 - k) Measure the maximum channel power and compute maximum gain when varying the signal generator 1 to a level from -90 dBm to -20 dBm in 1 dB steps within the RSSI dependent region and 10 dB steps outside the RSSI dependent region and report the six values closest to the limit, including at least two points from within the RSSI dependent region of operation. See gain limit charts in Annex D.
 - l) Repeat c) to k) for all operational uplink bands.
 - m) Variable Uplink gain timing is to be measured as follows.
 - n) Set the spectrum analyzer to the uplink frequency to be measured.
 - o) Set the span to 0 Hz with a sweep time of 10 seconds.
 - p) Set the power level of signal generator 1 to the lowest level of the RSSI dependent gain.
 - q) Select MAX HOLD and increase the power level of signal generator 1 by 10 dB for mobile booster and 20 dB for fixed indoor boosters. Signal generator 2 remains same, as described in c).
 - r) Ensure that the uplink gain decrease to the specified levels within 1 second for mobile devices and 3 seconds for fixed devices.
 - s) Repeat m) to r) for all operational uplink bands.

- FCC Rules Part 2 Section 2.1049

3.10.2 Measurement method

- 935210 D03 Wideband Consumer Signal Booster Measurement Guidance DR04-41516 §7.10
 - a) Connect the test equipment as shown in **Set-Up 1** to measure the characteristics of the test signals produced by the signal generator.
 - b) Set VBW to $\geq 3X$ RBW
 - c) Set the center frequency of the spectrum analyzer to the center of the operational band. The span will be adjusted for each modulation type and occupied bandwidth as necessary for accurately viewing the signals.
 - d) Set the signal generator for power level to match the values obtained in **Maximum power**.
 - e) Set the signal generator modulation type for GSM with a PRBS pattern and allow the trace on the signal generator to stabilize adjusting the span as necessary.
 - f) Set the spectrum analyzer RBW for 1% to 5% of the emissions bandwidth.
 - g) Capture the spectrum analyzer trace for inclusion in the test report.
 - h) Repeat steps c) to g) for CDMA and W-CDMA modulation adjusting the span as necessary for all uplink and downlink operational bands. (AWGN or LTE may be used in place of W-CDMA, as an option.)
 - i) Connect the test equipment as shown in **Set-Up 2**. Begin with the uplink output connected to the spectrum analyzer
 - j) Repeat steps c) to h) in this new configuration.

3.11 Oscillation detection

3.11.1 Specification

- FCC 13-21
- FCC Part 20.21 (e)(8)(ii)(A)

3.11.2 Measurement method

- 935210 D03 Wideband Consumer Signal Booster Measurement Guidance DR04-41516 §7.11
 - a) Connect the EUT set for normal operation to the test equipment as shown in **Set-Up** beginning with the spectrum analyzer on the uplink output side of the RF path. Ensure that the RF coupled path is connected to the spectrum analyzer.

Note: The band pass filter shall provide sufficient out-of-band rejection to prevent oscillations from occurring in bands not under test.
 - b) Set the spectrum analyzer's center frequency to the center of the band under test. Set the spectrum analyzer's span to equal or slightly exceed the width of the band under test. Set the spectrum analyzer for a continuous sweep, max-hold. Set the spectrum analyzer's RBW to at least 1 MHz and the VBW to > 3 times RBW.
 - c) Decrease the variable attenuator until the spectrum analyzer displays a signal within the band under test. Using a marker, identify the approximate center frequency of this signal on the max-hold display, then increase the attenuation by 10 dB. Reset the EUT.
 - d) Repeat step c) twice to ensure that the center of the signal created by the booster remains within 250 kHz of the spectrum analyzer's center frequency. If the frequency of the signal is unstable, ensure that the spectrum analyzer is centered between the frequency extremes observed. If the signal is wider than 1 MHz, ensure that the spectrum analyzer is centered on the signal by increasing the resolution bandwidth. Reset the EUT after each oscillation event if necessary. Set the spectrum analyzer's sweep trigger level such that it's just below the peak amplitude of the displayed oscillation signal from the EUT.
 - e) Set the spectrum analyzer to zero-span with a sweep time of 5 seconds, single-sweep with max-hold. The spectrum analyzer's sweep trigger level in this and subsequent steps shall be the level identified in step d).
 - f) Decrease the variable attenuator until the spectrum analyzer's sweep is triggered, then increase the attenuation 10 dB. Reset the EUT.
 - g) Reset the zero-span trigger of the spectrum analyzer and repeat step f) twice to ensure that the spectrum analyzer is reliably triggered, resetting the EUT after each oscillation event if necessary.
 - h) Reset the zero-span sweep trigger of the spectrum analyzer and reset the EUT with a power cycle.
 - i) Force the EUT to oscillate by reducing the attenuation.
 - j) Use the Marker function of the spectrum analyzer to measure the time from the on-set of oscillation until the EUT turns off by setting Marker 1 on the leading edge of the oscillation signal and Marker 2 on the trailing edge. The spectrum analyzer's sweep time may be altered to improve the time resolution of these cursors.
 - k) Capture the spectrum analyzer's zero-span trace for inclusion in the test report.
 - l) Repeat steps b) to k) for all operational uplink and downlink bands.
 - m) Set the spectrum analyzer's zero-span sweep time for longer than 1 minute and measure the restart time for each operational uplink and downlink band.
 - n) Replace the normal operating EUT for the EUT set-up to support an anti-oscillation test mode.
 - o) Set the spectrum analyzer's zero-span time for a minimum of 120 seconds and a single sweep.
 - p) Manually trigger the spectrum analyzer's zero-span sweep and a manually force the booster into oscillation as in step i).
 - q) When the sweep is complete place cursors between the first two oscillation detections and save the plot for inclusion in the test report. The time between restarts must match the manufacturer's timing for the test mode and there can be no more than 5 restarts.
 - r) Repeat steps m) to q) for all operational uplink and downlink bands.

3.12 Radiated spurious emission

3.12.1 Specification

- FCC Rules Part 2 Section 2.1053

3.12.2 Measurement method

- 935210 D03 Wideband Consumer Signal Booster Measurement Guidance DR04-41516 §7.12
 - a) Place the EUT on an OATS or semi-anechoic chamber turntable 3 m from the receiving antenna.
 - b) Connect the EUT to the test equipment as shown in **Set-Up** beginning with the uplink output
 - c) Set the signal generator for the center frequency of the operational band under test with the power level set at P_{IN} from **Maximum power** with CW signal.
 - d) Measure the radiated spurious emissions from the EUT from lowest to the highest frequencies as specified in § 2.1057. Maximize the radiated emissions by utilizing the procedures described in **Clause 8 of ANSI C63.4-2009**.
 - e) Capture the peak emissions plots using a peak detector with Max-Hold for inclusion in the test report. Tabular data is acceptable in lieu of spectrum analyzer plots.
 - f) Repeat steps c) to e) for all operational bands.

4. RF exposure statement

According to FCC Part1 Section 1.1307, systems operating under the provisions of this section shall be operated in a manner that ensures that the public is not exposed to radio frequency energy level in excess of the Commission's guidelines.

According to FCC Part1 Section 1.1310 and 2.1091 RF exposure is calculated by Friis transmission formula.

Frequency Range [MHz]	Electric Field Strength [V/m]	Magnetic Field Strength [A/m]	Power Density [mW/cm ²]	Averaging Time [minute]
Limits for General Population/Uncontrolled Exposure				
0.3 – 1.34	614	1.63	100	30
1.34 – 30	824/f	2.19/f	180/f ²	30
30 – 300	27.5	0.073	0.2	30
300 – 1500	-	-	f/1500	30
1500 – 100 000	-	-	1.0	30

Limits for General Population/Uncontrolled Exposure

Here, f = frequency in MHz

4.1 Friis transmission formula

$$P_d = (P_{out} \times G) / (4\pi r^2)$$

P_d = Power density

P_{out} = power input to antenna

G = power gain

r = distance to the center of radiation of the antenna

4.2 Information of Antenna

The Coaxial Cable is used for RF distribution to the Service Antenna (2 dBi gain) from AVHR-5000N and to the Donnor Antenna (5.5 dBi gain) from AVHR-5000N.

RF cable type is FME which the length is 30 cm and the Loss is 0.2 dB ~ 0.3 dB /1 m

• Model Name : TQC-900-1800E (Down link antenna)

Antenna Gain;

- 890 MHz – 960 MHz : 2 dBi
- 1710 MHz – 1990 MHz : 2 dBi

• **Model Name : TQC-900-1800C2 (Up link antenna)**

Antenna Gain;

- 890 MHz – 960 MHz : 5.0 dBi
- 1710 MHz – 1990 MHz : 5.0 dBi

4.3 Calculation of MPE at 20 cm

Band	Link	Frequency [MHz]	Output power [dBm]	Antenna gain [dBi]	Cable loss [dBi]	EIRP		Power density [mW/cm ²]	Limit [mW/cm ²]
						[dBm]	[mW]		
Celluar	Down	890.819	10.14	3.00	0.00	13.14	20.63	0.004 1016	0.593 879
	Up	842.656	23.01	5.00	0.00	28.01	632.41	0.125 878	0.561 771
PCS	Down	1937.20	10.32	3.00	0.00	13.32	21.47	0.004 275	1.000 000
	Up	1879.95	23.07	5.00	0.00	28.07	641.20	0.127 629	1.000 000

• Cellular

The maximum conducted power is 23.01 dBm; antenna is fix-mounted with a maximum gain and cable loss of 5.0 dBi gain.

Therefore, to comply with RF Exposure Requirement, the MPE is calculated.

The maximum Peak EIRP calculated is 28.01 dBm.

The Power Density can be calculated using the formula

It is considered that 20 cm is the minimum distance that a user can go closer to the EUT.

At 0.2 m, $S = 0.125 \text{ mW/cm}^2$, which is below the MPE Limit of 0.562 mW/cm^2

• PCS

The maximum conducted power is 23.07 dBm; antenna is fix-mounted with a maximum gain and cable loss of 5.0 dBi gain.

Therefore, to comply with RF Exposure Requirement, the MPE is calculated.

The maximum Peak EIRP calculated is 28.07 dBm.

It is considered that 20 cm is the minimum distance that a user can go closer to the EUT.

At 0.2 m, $S = 0.127 \text{ mW/cm}^2$, which is below the MPE Limit of 1.000 mW/cm^2

• Cellular + PCS

Power density on up link side for Cellular and PCS are 25.1 % and 14.8 % of the limit, so combined they are still well below 100 % of the limit.
