Product Description

The Satellite phone consist of an L-Band Transceiver (LBT) capable of simultaneous transmit and receive (duplex) operation covering the frequency range of 1616MHz to 1626.5MHz. The frequency accesses used for duplex channels are organised into sub-bands each of which contains eight frequency accesses. Each sub-band, therefore occupies 333.33 kHz (i.e. $8 \times 41.667\text{kHz}$). Up to 30 sub-bands containing 240 frequency accesses may be used for duplex channels.

Channel number	=	See test results	

See Annex C for full list of test equipment

The test setup was as per the above diagram. The unit was tested on four channels. The unit was put into test mode and set to operate at maximum power and with a random modulating signal using the manual test command 27 XXX YY Z# (See Annex D for explanation of test command).

Frequency MHz	Attenuator and cable loss dB	Level at Power Meter dBm	Antenna Gain dB	Duty Cycle Factor dB (See Annex D)	Carrier power dBm	Carrier power dBw	Limit dBW
Channel 1	62.54	-34.73	3	10.4	41.21	11.21	40
Channel 75	62.54	-35.48	3	10.4	40.46	10.46	40

Channel 241	62.54	-34.18	3	10.4	41.76	11.76	40

- Notes:
1. Duty Cycle Factor = $10 \times \log(1/X)$ Where $X = (T_{on} / T_{frame})$. See Annex E for duty cycle plots
 2. Correction Factor for dBm to dBW = -30dB
 3. Antenna gain of 3dBi is the worst case gain over an isotropic antenna

TRANSMITTER TESTS

EMISSIONS LIMITATIONS – CONDUCTED – PART 25.202 (f)

Ambient temperature = 20°C
Relative humidity = 54%
Supply voltage = +3.7 Vdc

Radio Laboratory

See Annex C for full list of test equipment

The test setup was as per the above diagram. The unit was tested on four channels. The unit was put into test mode and set to operate at maximum power and with a random modulating signal using the manual test command 27 XXX YY Z# (See Annex D for explanation of test command).

To enable an average measurement to be taken the gated input trigger of the spectrum analyser was used.

The Spurious limit is as follows:

On any frequency removed from the assigned frequency by the following percentage of the authorised bandwidth

±50%	-	100%	-25 dBc
±100%	-	250 %	-35 dBc
> ±250%			At least 43 + 10 log PdB

$$(10\log P_{\text{watts}}) - (43 + 10\log (P_{\text{watts}} * 1000)) = \text{LIMIT} = -13 \text{ dBm}$$

Where the Authorised Bandwidth = 41.667 kHz

The 3 kHz to 4 kHz bandwidth correction has been taken into account in the Ref level offset figure.

The Monaco Handset was found to comply with the limits

See plots in Annex F.

TRANSMITTER TESTS

SPURIOUS EMISSIONS – CONDUCTED – PART 25.202 (f) & 25.213

Ambient temperature = 26°C
 Relative humidity = 62%
 Supply voltage = +3.7 Vdc

Radio Laboratory

See Annex C for full list of test equipment

The test setup was as per the above diagram. The unit was tested on four channels. The unit was put into test mode and set to operate at maximum power and with a random modulating signal using the manual test command 27 XXX YY Z# (See Annex D for explanation of test command).

The Spurious limit was calculated as follows:

On any frequency removed from the assigned frequency by more than 250% of the authorised bandwidth

At least $43 + 10 \log(P) \text{ dB}$

$(10 \log P_{\text{watts}}) - (43 + 10 \log (P_{\text{watts}} * 1000)) = \text{LIMIT} = -13 \text{ dBm}$

RESULTS

Frequency Range (MHz)	Spectrum Analyser Level dBm	Attenuator and Cable Losses dB	3 kHz – 4 kHz Bandwidth Correction dB	Spurious Emission Level dBm	Limit dBm
30 MHz – 1610 MHz	No Significant Emissions Within 20dB's of the Limit				-13
1628.5 MHz – 2 GHz	No Significant Emissions Within 20dB's of the Limit				-13
2 GHz – 7 GHz	No Significant Emissions Within 20dB's of the Limit				-13
7 GHz – 12 GHz	No Significant Emissions Within 20dB's of the Limit				-13
12 GHz – 16.3 GHz	No Significant Emissions Within 20dB's of the Limit				-13

Notes :

1. Emissions Checked up to 10 times F_c
2. Limit Line D1 on Scan plots in Annex G already has cable and atten losses and 3kHz to 4 kHz Bandwidth correction taken into account

The Monaco Handset was found to comply with the limits

See plots in Annex G.

TRANSMITTER TESTS

SPURIOUS EMISSIONS – RADIATED – PART 25.202 (f) & 25.213

Ambient temperature = 18°C
 Relative humidity = 55%
 Conditions = OATS
 Supply voltage = +3.7 Vdc
 Supply Frequency = N/A

See Annex C for full list of test equipment

The test setup was as per the above diagram. The unit was tested on four channels. The unit was put into test mode and set to operate at maximum power and with a random modulating signal using the manual test command 27 XXX YY Z# (See Annex D for explanation of test command). The unit was mounted on a turntable and rotated through 360° to find the worst case emission.

The Spurious limit was calculated as follows:

On any frequency removed from the assigned frequency by more than 250% of the authorised bandwidth

At least $43 + 10 \log P_{dB}$

$(10 \log P_{watts}) - (43 + 10 \log (P_{watts} * 1000)) = \text{LIMIT} = -13 \text{ dBm}$

RESULTS

Frequency Range (MHz)	Spectrum Analyser Level dBm	Attenuator and Cable Losses dB	3 kHz – 4 kHz Bandwidth Correction dB	Spurious Emission Level dBm	Limit dBm
