EUT Software.

Revision Level: Firmware = 01.09.04 B-Alert Software = 01.05.04

Description: Firmware is stored in the microcontroller of the head units. The firmware controls data acquisition and transfers data at 115.2kBd to Bluetooth module. Transfer data over RF link is under BT module control. The ACQ program can control functions performed on the head unit via the host (BG dongle), including initiation of impedance monitoring and/or data acquisition.

EUT Operating Modes to be Tested -- list the operating modes to be used during test. It is recommended the equipment be tested while operating in a typical operation mode. FCC testing of personal computers and/or peripherals requires that a simple program generate a complete line of upper case H's. Provide a general description of all software, firmware, and PLD algorithms used in the equipment. List all code modules as described above, with the revision level used during testing. Consult with your TÜV Product Service Representative if additional assistance is required.

1. Acquisition mode - host unit (standard BT dongle) connected to PC, ACQ software operating on PC, and head unit within 20' of host unit.

EUT System Components -- List and describe all components which are part of the EUT. For FCC testing a minimum configuration is required. (ie. Mouse, Printer, Monitor, External Disk Drive, Motherboard, etc.)

Description	Model #	Serial #	FCC ID #
Head Unit	57-12	--	--
Sensor locator strip	Med-3-12	12-001	--

Support Equipment -- List and describe all support equipment which is not part of the EUT. (i.e. peripherals, simulators, etc)
