October 15, 2004

To Whom It May Concern:

This application for TCB Grant (QDARUBA6061) is based on the previously submitted and granted application for FCC ID QDARUBA60. Aruba Wireless Networks is adding the internal antennal and the frequency range from 5180-5250 MHz. The new test report submitted TUV51 lists these new additions, this test report is in addition to test report TUV24 REV E, issued September 3, 2004.

Test report TUV51 also mentions the OEM models OR-AP and OR-APWS which will be marketed by Aruba. Aruba plans to market the OEM equipment under the provisions of 2.929. Testing of the two OEM models is included in this test report to show that the emission characteristics have not been degraded as a result of the change in casing.

The electronic circuitry (pcb and wireless module) employed in the AP61, OR-AP and OR-APWS integral antenna products are identical to that utilized in the AP60. It is this reason that limited testing was completed on the AP61, OR-AP and OR-APWS variants.

Sincerely,

A handwritten signature in dark ink, appearing to read "Loren Vorreiter", written in a cursive style.

Loren Vorreiter
