5.2 Test Specifications

The EUT was tested according to the procedures in FCC Part 15 Subpart C section 15.247 and FCC Public Notice DA 00-705, and also to demonstrate compliance with Industry Canada RSS-210 6.2.2 (O).

5.3 Operation Mode

The EUT module was tested using the CSR Casira as the support test host. The EUT was embedded in and received power and data I/O from the host. A PC connection allowed commands to the module to be issued using the CSR Bluetest software to put the device into the correct test modes.

5.4 Documentation of test device

Documentation of the tested device has been reviewed by Hyper Corporation Engineers and found to be in compliance with applicable test specifications. All documentation is kept at Hyper Corporation's Quality Department in the 0210004 EMC Test Folder.

5.5 General and Special Conditions

The EUT received power from the test host, which was powered using an AC adaptor plugged into the ac mains. All testing was done in an indoor controlled environment with an average temperature of 24° C and relative humidity of 40%.

5.6 Equipment and Cable Configurations

The EUT was tested in the Casira develop system test platform for embedded Bluetooth modules. The only cabling considerations were the cable used to connect the antenna port to the measuring equipment.

6.1 Carrier Frequency Separation

6.1.1 Operation Environment

Temperature: 25.8°C

Relative Humidity: 45%

6.1.2 Test procedure

The carrier frequency separation per FCC 15.247(a)(1) / IC RSS210 6.2.2(o)(a1) was measured using a spectrum analyzer with the resolution (or IF) bandwidth (RBW) $\geq 1\%$ of the span, the span should be wide enough to capture the peaks of two adjacent channels, and the video (or average) bandwidth (VBW) should be $\geq$ RBW. The carrier frequency separation result is described as below:

6.1.3 Measured data

Channel	Frequency (MHz)	Measurement Frequency Separation (MHz)
1	2440.015	1.005
2	2441.020	-----
3	2442.015	.995

6.2.2 Test procedure

The carrier frequency separation per FCC 15.247(a)(1)(ii)/IC RSS210 6.2.2(o)(a3) was measured using a spectrum analyzer with RBW $\geq 1\%$ of the span. The VBW is $\geq$ RBW and the span shall be equal to the frequency band of operation. The number of hopping frequencies measured data is shown below.

6.2.3 Measured data of test results

6.3.2 Test procedure

The Time of Occupancy test case per FCC 15.247(a)(1)(ii)/ IC RSS210 6.2.2(o)(a3) was measured using a spectrum analyzer with RBW = 1 MHz. The VBW $\geq$ RBW and the zero span function of spectrum analyzer were enabled.

The worst case time of occupancy (Dwell Time) is (DH5 packet) (4 X 2.933 ms) (dwell time in 1 sec) X 30 seconds = 351.96 ms = 0.35196 sec < 0.4s in 30 sec. – Compliant
