

Test report

267135-1TRFWL

Date of issue: September 12, 2014

Applicant:

Redline Communications

Product:

Broad-band wireless infrastructure product

Model:

RDL-3000-RMG

FCC ID:

QC8-RDL3000RMG

IC Registration number:

4310A-RDL3000RMG

Specifications:

- ◆ **FCC 47 CFR Part 15 Subpart E, §15.407**
Unlicensed National Information Infrastructure Devices

Test location

Company name	Nemko Canada Inc.
Address	303 River Road
City	Ottawa
Province	Ontario
Postal code	K1V 1H2

1.2 Test specifications

FCC 47 CFR Part 15, Subpart E, Clause 15.407	Unlicensed National Information Infrastructure Devices
--	--

1.3 Test methods

789033 D02 General UNII Test Procedures New Rules v01 (June 6, 2014)	Guidelines for Compliance Testing of Unlicensed National Information Infrastructure (U-NII) Devices Part 15, Subpart E
662911 D01 Multiple Transmitter Output v02r01 (October 31, 2013)	Emissions testing of transmitters with multiple outputs in the same band (MIMO)
662911 D02 MIMO with Cross Polarized Antenna v01 (October 25, 2011)	Emissions testing of transmitters with multiple outputs in the same band (MIMO) with Cross Polarized Antenna
ANSI C64.3 v 2003	American National Standard for Methods of Measurement of Radio- Noise Emissions from Low-Voltage Electrical and Electronic Equipment in the Range of 9 kHz to 40 GHz

1.4 Statement of compliance

In the configuration tested, the EUT was found compliant.

Testing was completed against all relevant requirements of the test standard. Results obtained indicate that the product under test complies in full with the requirements tested. The test results relate only to the items tested.

See "Summary of test results" for full details.

1.5 Exclusions

None

1.6 Test report revision history

Revision #	Details of changes made to test report
TRF	Original report issued

Section 2. Summary of test results

2.1 FCC Part 15 Subpart C, general requirements test results

Part	Test description	Verdict
\$15.207(a)	Conducted limits	Pass
\$15.31(e)	Variation of power source	Pass ¹
\$15.203	Antenna requirement	Pass ²

Notes: ¹Measurements of the variation of the input power or the radiated signal level of the fundamental frequency component of the emission, as appropriate, was performed with the supply voltage varied between 85 % and 115 % of the nominal rated supply voltage. No noticeable output power variation was observed

²The Antennas are located within the enclosure of EUT and not user accessible.

2.2 FCC Part 15 Subpart E, test results

Part	Test description	Verdict
\$15.403(i)	Emission bandwidth	Not applicable
\$15.407(a)(1)	5.15–5.25 GHz band power and density limits	Pass
\$15.407(a)(2)	5.25–5.35 GHz and 5.47–5.725 GHz bands power and density limits	Not applicable
\$15.407(a)(3)	5.725–5.850 GHz band power and density limits	Not applicable
\$15.407(b)(1)	5.15–5.25 GHz band undesired emission limits	Pass
\$15.407(b)(2)	5.25–5.35 GHz band undesired emission limits	Not applicable
\$15.407(b)(3)	5.47–5.725 GHz band undesired emission limits	Not applicable
\$15.407(b)(4)	5.725–5.850 GHz band undesired emission limits	Not applicable
\$15.407(b)(6)	Unwanted emissions below 1 GHz	Pass
\$15.407(b)(7)	Radiated emissions within restricted bands	Pass
\$15.407(e)	6 dB bandwidth for 5.725–5.850 GHz band	Not applicable
\$15.407(g)	Frequency stability	Pass
\$15.407(h)(1)	Transmit power control (TPC) ¹	Not applicable
\$15.407(h)(2)	Dynamic Frequency Selection (DFS) ¹	Not applicable

Note: ¹Not applicable for devices operating within 5.15–5.25 GHz U-NII band.

Section 3. Equipment under test (EUT) details

3.1 Sample information

Receipt date	August 6, 2014
Nemko sample ID number	1

3.2 EUT information

Product name	Broad-band wireless infrastructure product
Model	RDL-3000-RMG
Serial number	149PC12480006

3.3 Technical information

Operating band	5150–5250 MHz
Operating frequency	5155–5247.5 MHz (5 MHz channel), 5160–5245 MHz (10 MHz channel) and 5170–5240 MHz (20 MHz channel)
Modulation type	OFDM using 64-QAM, 16-QAM, QPSK and BPSK modulation for sub-carriers
Occupied bandwidth (99 %)	4.1 MHz (5 MHz channel), 8.17 MHz (10 MHz channel), 16.41 MHz (20 MHz channel)
Emission designator	W7D
Power requirements	48 V _{DC} PoE via 120 V _{AC} , 60 Hz
Antenna information	19 dBi Dual Polarization/ Dual Slant Subscriber Antenna 4.9–6.1 GHz, Redline 30-00328-50
	10 dBi L-COM HG5158DP-10U, L-COM
	29 dBi Redline APD-DB05-2ft-RAD-01 Parabolic Antenna, 4.9–5.9 GHz, 2-ft, dual polarity
	The EUT is professionally installed.

3.4 Product description and theory of operation

The EUT is a 2x2 MIMO point-to-multipoint (PMP) carrier grade broadband wireless infrastructure product, designed to operate in the 5150–5250 MHz band.

3.5 EUT exercise details

The EUT was controlled to transmit at desired frequency and modulation from laptop using Art GUI software and telnet session.

3.6 EUT setup diagram

Figure 3.6-1: Setup diagram

3.7 EUT sub assemblies

Table 3.7-1: EUT sub assemblies

Description	Brand name	Model/Part number	Serial number
PoE	Cincon Electronics Co.	TRG60A-POE-L	1127

Section 4. Engineering considerations

4.1 Modifications incorporated in the EUT

There were no modifications performed to the EUT during this assessment.

4.2 Technical judgment

None

4.3 Deviations from laboratory tests procedures

No deviations were made from laboratory procedures.

Section 5. Test conditions

5.1 Atmospheric conditions

Temperature	15–30 °C
Relative humidity	20–75 %
Air pressure	860–1060 mbar

When it is impracticable to carry out tests under these conditions, a note to this effect stating the ambient temperature and relative humidity during the tests shall be recorded and stated.

5.2 Power supply range

The normal test voltage for equipment to be connected to the mains shall be the nominal mains voltage. For the purpose of the present document, the nominal voltage shall be the declared voltage, or any of the declared voltages $\pm 5\%$, for which the equipment was designed.

Section 6. Measurement uncertainty

6.1 Uncertainty of measurement

Nemko Canada Inc. has calculated measurement uncertainty and is documented in EMC/MUC/001 "Uncertainty in EMC measurements." Measurement uncertainty was calculated using the methods described in CISPR 16-4 Specification for radio disturbance and immunity measuring apparatus and methods – Part 4: Uncertainty in EMC measurements; as well as described in UKAS LAB34: The expression of Uncertainty in EMC Testing. Measurement uncertainty calculations assume a coverage factor of $K=2$ with 95% certainty.

Section 7. Test equipment

7.1 Test equipment list

Power sensor	Agilent	N1922A	FA001947	1 year	Mar. 04/15
Temperature chamber	Thermotron	SM-16C	FA001030	1 year	NCR
Multimeter	Fluke	16	FA001831	1 year	Feb. 04/15

Note: NCR - no calibration required, VOU - verify on use

Section 8. Testing data

8.1 FCC 15.207(a) AC power line conducted emissions limits

8.1.1 Definitions and limits

Except as shown in paragraphs (b) and (c) of this section, for an intentional radiator that is designed to be connected to the public utility (AC) power line, the radio frequency voltage that is conducted back onto the AC power line on any frequency or frequencies, within the band 150 kHz to 30 MHz, shall not exceed the limits in the following table, as measured using a 50 μ H/50 Ω line impedance stabilization network (LISN). Compliance with the provisions of this paragraph shall be based on the measurement of the radio frequency voltage between each power line and ground at the power terminal. The lower limit applies at the boundary between the frequency ranges.

Table 8.1-1: Conducted emissions limit

Frequency of emission (MHz)	Conducted limit (dB μ V)	
	Quasi-peak	Average
0.15–0.5	66 to 56*	56 to 46*
0.5–5	56	46
5–30	60	50

Note: * - Decreases with the logarithm of the frequency.

8.1.2 Test summary

Test date	August 6, 2014	Temperature	22 °C
Test engineer	Andrey Adelberg	Air pressure	1007 mbar
Verdict	Pass	Relative humidity	32 %

8.1.3 Observations, settings and special notes

The EUT was set up as tabletop configuration.

The spectral scan has been corrected with transducer factors (i.e. cable loss, LISN factors, and attenuators) for determination of compliance.

A preview measurement was generated with the receiver in continuous scan mode. Emissions detected within 6 dB or above limit were re-measured with the appropriate detector against the correlating limit and recorded as the final measurement.

Receiver settings for preview measurements:

Resolution bandwidth	9 kHz
Video bandwidth	30 kHz
Detector mode	Peak and Average
Trace mode	Max Hold
Measurement time:	100 ms

Receiver settings for final measurements:

Resolution bandwidth	9 kHz
Video bandwidth	30 kHz
Detector mode	Quasi-Peak and Average
Trace mode	Max Hold
Measurement time	1000 ms

8.1.4 Test data

8.2 FCC 15.403(i) Emission bandwidth

8.2.1 Definitions and limits

For purposes of this subpart the emission bandwidth shall be determined by measuring the width of the signal between two points, one below the carrier center frequency and one above the carrier center frequency, that are 26 dB down relative to the maximum level of the modulated carrier. Determination of the emissions bandwidth is based on the use of measurement instrumentation employing a peak detector function with an instrument resolution bandwidth approximately equal to 1.0 percent of the emission bandwidth of the device under measurement.

8.2.2 Test summary

Test date	August 11, 2014	Temperature	23 °C
Test engineer	Andrey Adelberg	Air pressure	1002 mbar
Verdict	Pass	Relative humidity	31 %

8.2.3 Observations, settings and special notes

Spectrum analyser settings:

Resolution bandwidth	≥ 1 % of emission BW
Video bandwidth	≥ 3 × RBW
Frequency span	10 MHz for 5 MHz channel; 20 MHz for 10 MHz channel and 40 MHz for 20 MHz channel
Detector mode	Peak
Trace mode	Max Hold

8.2.4 Test data

8.3 FCC 15.407(a)(1) 5.15–5.25 GHz band output power, EIRP and spectral density limits

8.3.1 Definitions and limits

- (i) For an outdoor access point operating in the band 5.15–5.25 GHz, the maximum conducted output power over the frequency band of operation shall not exceed 1 W provided the maximum antenna gain does not exceed 6 dBi. In addition, the maximum power spectral density shall not exceed 17 dBm in any 1 MHz band. If transmitting antennas of directional gain greater than 6 dBi are used, both the maximum conducted output power and the maximum power spectral density shall be reduced by the amount in dB that the directional gain of the antenna exceeds 6 dBi. The maximum e.i.r.p. at any elevation angle above 30 degrees as measured from the horizon must not exceed 125 mW (21 dBm).
- (ii) For an indoor access point operating in the band 5.15–5.25 GHz, the maximum conducted output power over the frequency band of operation shall not exceed 1 W provided the maximum antenna gain does not exceed 6 dBi. In addition, the maximum power spectral density shall not exceed 17 dBm in any 1 MHz band. If transmitting antennas of directional gain greater than 6 dBi are used, both the maximum conducted output power and the maximum power spectral density shall be reduced by the amount in dB that the directional gain of the antenna exceeds 6 dBi.
- (iii) For fixed point-to-point access points operating in the band 5.15–5.25 GHz, the maximum conducted output power over the frequency band of operation shall not exceed 1 W. Fixed point-to-point U-NII devices may employ antennas with directional gain up to 23 dBi without any corresponding reduction in the maximum conducted output power or maximum power spectral density. For fixed point-to-point transmitters that employ a directional antenna gain greater than 23 dBi, a 1 dB reduction in maximum conducted output power and maximum power spectral density is required for each 1 dB of antenna gain in excess of 23 dBi. Fixed, point-to-point operations exclude the use of point-to-multipoint systems, omnidirectional applications, and multiple collocated transmitters transmitting the same information. The operator of the U-NII device, or if the equipment is professionally installed, the installer, is responsible for ensuring that systems employing high gain directional antennas are used exclusively for fixed, point-to-point operations.
- (iv) For mobile and portable client devices in the 5.15–5.25 GHz band, the maximum conducted output power over the frequency band of operation shall not exceed 250 mW provided the maximum antenna gain does not exceed 6 dBi. In addition, the maximum power spectral density shall not exceed 11 dBm in any 1 MHz band. If transmitting antennas of directional gain greater than 6 dBi are used, both the maximum conducted output power and the maximum power spectral density shall be reduced by the amount in dB that the directional gain of the antenna exceeds 6 dBi.
- (4) The maximum conducted output power must be measured over any interval of continuous transmission using instrumentation calibrated in terms of an rms-equivalent voltage.
- (5) The maximum power spectral density is measured as a conducted emission by direct connection of a calibrated test instrument to the equipment under test. If the device cannot be connected directly, alternative techniques acceptable to the Commission may be used. Measurements in the 5.15–5.25 GHz, 5.25–5.35 GHz, and the 5.47–5.725 GHz bands are made over a bandwidth of 1 MHz or the 26 dB emission bandwidth of the device, whichever is less. A narrower resolution bandwidth can be used, provided that the measured power is integrated over the full reference bandwidth.

8.3.2 Test summary

Test date	August 15, 2014	Temperature	22 °C
Test engineer	Andrey Adelberg	Air pressure	1004 mbar
Verdict	Pass	Relative humidity	32 %

8.3.3 Observations, settings and special notes

The output power test was performed according to 789033 D02 General UNII Test Procedures New Rules, section E) 2) b) Method SA-1: trace averaging with the EUT transmitting at full power throughout each sweep. The PPSD test was performed according to 789033 D01 General UNII Test Procedures New Rules, section F. As per manufacturer declaration, radio module RDL-3000-RM, FCC ID: QC8-RDL3000RM, when operates in MIMO A (STBC/STC) mode or MIMO B (spatial multiplexing) modes, the only modes in which it transmits from both antennas, the transmitter output signals are completely uncorrelated.

Spectrum analyser settings:

Resolution bandwidth	1 MHz
Video bandwidth	≥3 MHz
Frequency span	≥99% of the occupied bandwidth
Detector mode	RMS with video triggering on full power pulses
Trace mode	Power Averaging over 100 sweeps

Combined average output power was calculated as follows: $P_{combined} = 10 \times \log_{10} \left((10^{P_{cho}/10}) + (10^{P_{ch1}/10}) \right)$

EIRP was calculated as follows: $EIRP = P_{combined} + \text{antenna gain}$

Combined PPSD was calculated as follows: $PPSD_{combined} = 10 \times \log_{10} \left((10^{PSD_{cho}/10}) + (10^{PSD_{ch1}/10}) \right)$

Table 8.3-1: Elevation vs gain for L-COM HG5158DP-10U, 10 dBi antenna

Angle, deg	Antenna gain, dBi
<30	+10
>30	-15

Note: cable loss is 1 dB

Output power limit for 10 dBi antenna was calculated as follows: $30 \text{ dBm} - (10 \text{ dBi} - 1 \text{ dB} - 6 \text{ dBi}) = 27.00 \text{ dBm}$

PPSD limit was calculated as follows: $17 - (10 - 1 - 6) = 14.00 \text{ dBm/MHz}$

Table 8.3-2: Elevation vs gain for Redline 30-00328-50, 19 dBi antenna

Angle, deg	Antenna gain, dBi
<30	+19
>30	-10

Note: no cable loss

Output power limit for 19 dBi antenna was calculated as follows: $30 \text{ dBm} - (19 \text{ dBi} - 6 \text{ dBi}) = 17.00 \text{ dBm}$

PPSD limit was calculated as follows: $17 - (19 - 6) = 4.00 \text{ dBm/MHz}$

Table 8.3-3: Elevation vs gain for Redline APD-DB-05-2ft-RAD-01, 29 dBi antenna

Angle, deg	Antenna gain, dBi
<30	+29
>30	-28

Note: cable loss is 1.5 dB

Output power limit for 29 dBi antenna was calculated as follows: $30 \text{ dBm} - (29 \text{ dBi} - 1.5 \text{ dB} - 6 \text{ dBi}) = 8.50 \text{ dBm}$

PPSD limit was calculated as follows: $17 - (29 - 1.5 - 6) = -4.50 \text{ dBm/MHz}$

8.3.4 Test data

8.4 FCC 15.407(b) Spurious (out-of-band) emissions

8.4.1 Definitions and limits

- (1) For transmitters operating in the 5.15–5.25 GHz band: all emissions outside of the 5.15–5.35 GHz band shall not exceed an EIRP of –27 dBm/MHz.
(5) The emission measurements shall be performed using a minimum resolution bandwidth of 1 MHz. A lower resolution bandwidth may be employed near the band edge, when necessary, provided the measured energy is integrated to show the total power over 1 MHz.
(6) Unwanted emissions below 1 GHz must comply with the general field strength limits set forth in § 15.209.
(7) The provisions of § 15.205 apply to intentional radiators operating under this section.
(8) When measuring the emission limits, the nominal carrier frequency shall be adjusted as close to the upper and lower frequency block edges as the design of the equipment permits.

Table 8.4-1: FCC §15.209 – Radiated emission limits

Frequency, MHz	Field strength of emissions		Measurement distance, m
	µV/m	dBµV/m	
0.009–0.490*	2400/F	$67.6 - 20 \times \log_{10}(F)$	300
0.490–1.705*	24000/F	$87.6 - 20 \times \log_{10}(F)$	30
1.705–30.0*	30	29.5	30
30–88	100	40.0	3
88–216	150	43.5	3
216–960	200	46.0	3
above 960	500	54.0	3

Notes: In the emission table above, the tighter limit applies at the band edges.

For frequencies above 1 GHz the limit on peak RF emissions is 20 dB above the maximum permitted average emission limit applicable to the equipment under test

8.4.2 Test summary

Test date	August 15, 2014	Temperature	22 °C
Test engineer	Andrey Adelberg	Air pressure	1005 mbar
Verdict	Pass	Relative humidity	32 %

8.4.3 Observations, settings and special notes

The spectrum was searched from 30 MHz to 40 GHz.

Radiated measurements were performed at a distance of 3 m, the EUT was transmitting on both MIMO chains simultaneously.

Radiated emissions were performed while both antenna connectors were terminated with 50 Ω load. No spurious emissions were detected within 10 dB below the limit.

Spectrum analyser for peak conducted measurements within restricted bands below 1 GHz:

Resolution bandwidth	100 kHz
Video bandwidth	300 kHz
Detector mode	Peak
Trace mode	Max Hold

Average limit line was calculated as follows:

For 10 dBi antenna: $54 \text{ dB}\mu\text{V/m} - 95.23 \text{ dB} - 10 \times \log_{10}(2) \text{ dB} - (10 \text{ dBi} - 1 \text{ dB}) - 4.7 \text{ dB} = -57.93 \text{ dBm}$

For 19 dBi antenna: $54 \text{ dB}\mu\text{V/m} - 95.23 \text{ dB} - 10 \times \log_{10}(2) \text{ dB} - 19 \text{ dBi} - 4.7 \text{ dB} = -67.93 \text{ dBm}$

For 29 dBi antenna: $54 \text{ dB}\mu\text{V/m} - 95.23 \text{ dB} - 10 \times \log_{10}(2) \text{ dB} - (29 \text{ dBi} - 1.5 \text{ dB}) - 4.7 \text{ dB} = -76.43 \text{ dBm}$

Spectrum analyser for peak measurements within restricted bands above 1 GHz:

Resolution bandwidth	1 MHz
Video bandwidth	3 MHz
Detector mode	Peak
Trace mode	Max Hold

Spectrum analyser for average conducted measurements within restricted bands above 1 GHz:

Resolution bandwidth	1 MHz
Video bandwidth	10 MHz
Detector mode	RMS
Trace mode	Power average
Number of averaging traces	$100 \times (1 / \text{duty cycle})$: 370 (5 MHz), 385 (10 MHz) and 455 (20 MHz)

If all peak measurements satisfy the average limit, then average measurements are not required. Average limit line was calculated as follows:

For 10 dBi antenna: $54 \text{ dB}\mu\text{V/m} - 95.23 \text{ dB} - 10 \times \log_{10}(2) \text{ dB} - (10 \text{ dBi} - 1 \text{ dB}) = -53.23 \text{ dBm}$

For 19 dBi antenna: $54 \text{ dB}\mu\text{V/m} - 95.23 \text{ dB} - 10 \times \log_{10}(2) \text{ dB} - 19 \text{ dBi} = -63.23 \text{ dBm}$

For 29 dBi antenna: $54 \text{ dB}\mu\text{V/m} - 95.23 \text{ dB} - 10 \times \log_{10}(2) \text{ dB} - (29 \text{ dBi} - 1.5 \text{ dB}) = -71.73 \text{ dBm}$

Peak limit is 20 dB higher than the average limit.

Spectrum analyser for peak conducted measurements outside restricted bands:

Resolution bandwidth	1 MHz
Video bandwidth	3 MHz
Detector mode	Peak
Trace mode	Max Hold

The limit line was calculated as follows:

For 10 dBi antenna: $-27 \text{ dBm/MHz} - 10 \times \log_{10}(2) - (10 \text{ dBi} - 1 \text{ dB}) = -39.00 \text{ dBm/MHz}$

For 19 dBi antenna: $-27 \text{ dBm/MHz} - 10 \times \log_{10}(2) - 19 \text{ dBi} = -49.00 \text{ dBm/MHz}$

For 29 dBi antenna: $-27 \text{ dBm/MHz} - 10 \times \log_{10}(2) - (29 \text{ dBi} - 1.5 \text{ dB}) = -57.50 \text{ dBm/MHz}$

Note: an out-of-band emission that complies with both the peak and average limits of § 15.209 is not required to satisfy the -27 dBm/MHz maximum emission limit.

8.4.4 Test data

Figure 8.4-1: Duty cycle for 5 MHz channel

Figure 8.4-2: Duty cycle for 10 MHz channel

Figure 8.4-3: Duty cycle for 20 MHz channel

Duty cycle correction factor calculations:

For 5 MHz channel

T_{XON} is 266.03 μ s; $T_{XPERIOD}$ is 996.80 μ s; Duty cycle = 0.27; Correction Factor = $10 \times \log_{10} (1 / 0.27) = 5.69$ dB

For 10 MHz channel

T_{XON} is 136.20 μ s; $T_{XPERIOD}$ is 530.45 μ s; Duty cycle = 0.26; Correction Factor = $10 \times \log_{10} (1 / 0.26) = 5.85$ dB

For 20 MHz channel

T_{XON} is 68.11 μ s; $T_{XPERIOD}$ is 304.49 μ s; Duty cycle = 0.22; Correction Factor = $10 \times \log_{10} (1 / 0.22) = 6.58$ dB

0 °C, Nominal	5.199946015	55
-10 °C, Nominal	5.199946118	158
-20 °C, Nominal	5.199946108	148
-30 °C, Nominal	5.199946040	80

8.5.4 Test data, continued

Table 8.5-3: Frequency drift measurement for 20 MHz channel

Test conditions	Frequency, GHz	Drift, Hz
+50 °C, Nominal	5.199945366	-114
+40 °C, Nominal	5.199944901	-579
+30 °C, Nominal	5.199945323	-157
+20 °C, +15 %	5.199945376	-104
+20 °C, Nominal	5.199945480	Reference
+20 °C, -15 %	5.199945481	1
+10 °C, Nominal	5.199945570	90
0 °C, Nominal	5.199945573	93
-10 °C, Nominal	5.199945546	66
-20 °C, Nominal	5.199945695	215
-30 °C, Nominal	5.199945625	145

Table 8.5-4: Band edge drift calculation

Channel bandwidth, MHz	-26 dBc lower cross point, GHz	Max negative drift, Hz	Drifted lower cross point, GHz	Band edge, GHz	Margin, MHz
5	5.15278846	312	5.152788150	5.15	2.788
10	5.15535256	290	5.155352274	5.15	5.352
20	5.16070513	579	5.160704550	5.15	10.705

Channel bandwidth, MHz	-26 dBc upper cross point, GHz	Max positive drift, Hz	Drifted upper cross point, GHz	Band edge, GHz	Margin, MHz
5	5.24971154	221	5.249711760	5.25	0.288
10	5.24964744	158	5.249647594	5.25	0.352
20	5.24929487	215	5.249295087	5.25	0.705

Notes: Drifted lower cross point = -26 dBc lower cross point – max negative drift. Drifted upper cross point = -26 dBc upper cross point + max positive drift.

Section 9. Block diagrams of test set-ups

9.1 Radiated emissions set-up

9.2 Conducted emissions set-up
