Project Number: 3071804**Report Number: 3071804EMC04****Revision Level: 0****Client: Airo Wireless, Inc.****Equipment Under Test: Intrinsically Safe Cellular Phone****Model: I-SAFE™28****Applicable Standards: FCC Part 15 Subpart C, § 15.247****RSS-210, Issue 8, December 2010****ANSI C63.10: 2009****Report issued on: 11 September 2013****Test Result: Compliant**

Tested by:

Jeremy O. Pickens, Senior EMC Engineer

Reviewed by:

David Schramm, EMC Manager**Remarks:**

This report details the results of the testing carried out on one sample, the results contained in this test report do not relate to other samples of the same product. The manufacturer should ensure that all products in series production are in conformity with the product sample detailed in this report.

This report may only be reproduced and distributed in full. If the product in this report is used in any configuration other than that detailed in the report, the manufacturer must ensure the new system complies with all relevant standards. Any mention of SGS International Electrical Approvals or Testing done by SGS International Electrical Approvals in connection with distribution or use of the product described in this report must be approved by SGS international Electrical Approvals in writing.

1.1 Modifications Required for Compliance

None

2 General Information

2.1 Client Information

Name: Airo Wireless, Inc.

Address: 12 Piedmont Center, Suite 205

City, State, Zip, Country: Atlanta, GA 30305

2.2 Test Laboratory

Name: SGS North America, Inc.

Address: 620 Old Peachtree Road NW, Suite 100

City, State, Zip, Country: Suwanee, GA 30024, USA

2.3 General Information of EUT

Type of Product: Intrinsically Safe Cellular Phone

Model: I-SAFE™ 28

Serial Number: Not Labeled

FCC ID: QDL-ISAFE28

Frequency Range: 2402 to 2480 MHz

Number of channels: 79

Modulation type: GFSK, EDR 2, EDR 3

Channel spacing: 1 MHz

Antenna: Integral

Rated Voltage: 3.7 VDC Internal Battery

Sample Received Date: 03 July 2013

Dates of testing: 23 July – 05 September 2013

Test Report Number: 3071804EMC04 Rev: 0

Airo Wireless / I-SAFE™28

Page: 5 of 37

Operating Modes and Conditions

The EUT was configured in software to allow the user to control the EUT to run continuously exercising all modes of operation.

During testing, the hopping sequence was stopped in accordance with Section 5.1 of ANSI C63.10-2009 so that the low, mid and high channels could be tested independently.

Modulations used: For fundamental and spurious measurements, the EUT was configured to operate continuously with Bluetooth modulation enabled.

As specified in Section 5.10.5 of ANSI C63.10:2009:

- Software was designed to allow the EUT to operate
 - at 100 % duty cycle
 - at the worst-case duty cycle to allow measurements in instances where an average correction factor needs to be determined to calculate the average field strength from the measured peak field strength
- The software allowed configuration and operation on all available unlicensed wireless device channels.
- The software allowed configuration and operation using all available modulations and data rates
- The software allowed configuration and operation on all available power out levels
- Since this is a frequency hopping system, the software allowed the hopping sequence to be turned off

6 Field Strength of Spurious Radiation

6.1 Test Result

Test Description	Test Specification	Test Result
Field strength of spurious radiation	15.249 (a) and 15.209 RSS 210 2.6, A2.9 (1)(2)	Compliant

6.2 Test Method

The initial preliminary exploratory scans were performed over the frequency range as indicated in the tables below using the max hold function and incorporating a Peak detector and using TILE! software. The final test data was measured using a Quasi-Peak detector below 1GHz and a Peak detector above 1GHz. For harmonics of the fundamental, Average measurements were made by correcting the peak value with the duty cycle correction factor. For emissions other than harmonics of the fundamental, the Average measurements were made using the Average detector. The receivers resolution bandwidth was set to 120 kHz for measurements taken in the 30MHz to 1GHz frequency range and 1MHz for measurements for 1GHz and higher. Measurements were made with the antenna positioned in both the horizontal and vertical planes of polarization. The antenna height was varied from 1 m to 4 m and the EUT was rotated 360° to find the maximum emitting point for each frequency. The radiated measurements were recorded and compared to the limits indicated in the table below.

Test distance:

30 MHz to 1 GHz - The EUT to measurement antenna distance is 3 meters

1 to 18 GHz - The EUT to measurement antenna distance is 3 meters

18 to 40 GHz - The EUT to measurement antenna distance is 1 meter

Frequency	Limits ⁽¹⁾		Peak Limits dBuV/m
	Microvolts/m	dBuV/m	
30 - 88 MHz	100	40 ⁽²⁾	--
88 - 216 MHz	150	43.5 ⁽²⁾	--
216 - 960 MHz	200	46 ⁽²⁾	--
960 - 1000 MHz	500	54 ⁽²⁾	--
1 - 40 GHz	500	54 ⁽³⁾	74

(1) These limits are applicable to emissions outside of the intentional transmit frequency band.

(2) Quasi-peak limit

(3) Average limit

7 Radiated Emissions at Band Edge / Restricted Band

7.1 Test Result

Test Description	Test Specification	Test Result
Field strength of spurious radiation	15.247 (d) and 15.209	Compliant

7.2 Test Method

Peak and average field strength measurements were performed at the restricted band edges of 2390MHz and 2483.5MHz. Measurements were made using the conducted methods defined in Section 12 of FCC publication D01 DTS Meas Guidance v03r01. The measurements were recorded and using the equation $E = \text{EIRP} - 20\log D + 104.8$, the readings were converted to a radiated field strength equivalent. The resultant data were compared to the average limit of 54 dBμV/m and peak limit of 74 dBμV/m.

Measurements were made in the following modes of operation: 802.11g and n at low and high channels. The worst-case data rates of 6Mbit/s and MCS0 were used.

8 Power Spectral Density

8.1 Test Result

Test Description	Basic Standards	Test Result
Power Spectral Density	15.247(f), 15.247(e) ANSI C63.4:2009	Compliant

8.2 Test Method

The EUT was set at each channel and data rate to transmit continuously, the peak emission was located and set as the center frequency. It was connected via customer supplied cable to the spectrum analyzer. The span was reduced to 300 kHz, swept 100 times with a 3 kHz RBW, peak detector and trace averaged. The peak signal was then measured and reported. The limit is 8 dBm in any 3 kHz band during any time interval of continuous transmission.
