- 1) When I compared the data table in the new report, it appears that the margin of compliance is exactly the same but the raw data has changed. Please explain.

Please refer to the cover letter submitted in response to reference #24859. The format of many of the earlier reports showed raw data that was calculated from measured voltage (i.e. EIRP dBm=dBuV-107+95.2)

In order to better show the final calculations, the table was revised to show a direct dBm reading and a separate calculation of power to field strength.
