

TEST REPORT FROM RADIO FREQUENCY INVESTIGATION LTD.

Test Of: Nokia UK Ltd.
Cameron Imaging Phone 3650 (NHL-8) Mobile Phone Handset
(Bluetooth Mode)

To: F.C.C. Part 15 Subpart C: 2001
(Intentional Radiators)
Section 15.247

Test Report Serial No:
RFI/MPTB1/RP44367JD01

This Test Report Is Issued Under The Authority Of Richard Jacklin, Operations Director: 	Checked By: 
Tested By: 	Release Version No: PDF01
Issue Date: 23 December 2002	Test Dates: 18 December 2002 to 22 December 2002

This report covers the Bluetooth part of the Cameron 3650 (NHL-8) only.

BLUETOOTH is a trademark owned by the Bluetooth SIG, Inc., USA, and licensed to Radio Frequency Investigation Ltd.

This report is issued in Adobe Acrobat portable document format (PDF). It is only a valid copy of the report if it is being viewed in PDF format with the following security options not allowed:
Changing the document, Selecting text and graphics, Adding or changing notes and form fields.
Furthermore, the date of creation must match the issue date stated above.

This report may be copied in full.

The results in this report apply only to the sample(s) tested.

Radio Frequency Investigation Ltd, Ewhurst Park, Ramsdell, Basingstoke, Hampshire, RG26 5RQ, ENGLAND. Tel: +44 (0) 1256 851193 Fax: +44 (0) 1256 851192	Registered in England, No. 211 7901. Registered Office: Ewhurst Park, Ramsdell, Basingstoke, Hampshire RG26 5RQ

Test Of: Nokia UK Ltd.**Cameron Imaging Phone 3650 (NHL-8) Mobile Phone Handset (Bluetooth Mode)****To: F.C.C. Part 15 Subpart C: 2001 (Intentional Radiators) Section 15.247**

1. Client Information

Company Name:	Nokia UK Ltd.
Address:	Nokia House Summit Avenue Southwood Farnborough Hampshire GU14 0NG
Contact Name:	Mr A White

Test Of: Nokia UK Ltd.**Cameron Imaging Phone 3650 (NHL-8) Mobile Phone Handset (Bluetooth Mode)****To: F.C.C. Part 15 Subpart C: 2001 (Intentional Radiators) Section 15.247**

2. Equipment Under Test (EUT)

The following information (with the exception of the Date of Receipt) has been supplied by the client:

2.1. Identification Of Equipment Under Test (EUT)

Brand Name:	Nokia
Model Name or Number:	Cameron Imaging Phone
Unique Type Identification:	3650 (NHL-8)
IMEI Number:	004400/16/161824/2
Country of Manufacture:	Finland
Date of Receipt:	20 Dec 2002

Test Of: Nokia UK Ltd.

Cameron Imaging Phone 3650 (NHL-8) Mobile Phone Handset (Bluetooth Mode)

To: F.C.C. Part 15 Subpart C: 2001 (Intentional Radiators) Section 15.247

2.2. Description Of EUT

The equipment under test is a tri-band (900, 1800 & 1900) camera mobile handset, which supports IR and Bluetooth.

2.3. Modifications Incorporated In EUT

The EUT has not been modified from what is described by the Model Number and Unique Type Identification stated above.

2.4. Additional Information Related To Testing

Power Supply Requirement: (non-removable lithium ion battery)	Internal battery supply of 3.7 V
Power Supply Requirement: (AC Battery Charger)	Nominal 115 V 60 Hz AC Mains supply
Intended Operating Environment:	Within GSM/Bluetooth Network Coverage
Equipment Category:	Portable
Type of Unit:	Mobile handset
Weight:	130 g
Dimensions:	130 x 55 x 23 mm
Interface Ports:	Battery Connection Headset Connection
Highest Declared Generated Frequency within the EUT.	3980 MHz
Transmit Frequency Range Tested	2402 to 2481 MHz (Bluetooth)
Receive Frequency Range Tested	2402 to 2481 MHz (Bluetooth)
Maximum Measured Output Power (EIRP)	0.306 dBm, (Bluetooth)

Test Of: Nokia UK Ltd.

Cameron Imaging Phone 3650 (NHL-8) Mobile Phone Handset (Bluetooth Mode)

To: F.C.C. Part 15 Subpart C: 2001 (Intentional Radiators) Section 15.247

2.5. Support Equipment

The following support equipment was used to exercise the EUT during testing:

Description:	Universal Radio Communications Tester
Brand Name:	Rohde & Schwartz
Model Name or Number:	CMU200
Serial Number:	1100.0008.02
Connected to Port:	RF Link

Description:	Li-ion Battery
Brand Name:	Nokia
Model Name or Number:	BL-5C
Serial Number:	067040063663222411
Cable Length And Type:	N/A
Connected to Port:	Battery

Description:	AC Power Supply
Brand Name:	Nokia
Model Name or Number:	Travel Charger
Serial Number:	ACP-12U
Cable Length And Type:	175 cm
Connected to Port:	Charger

Description:	Headset
Brand Name:	Nokia
Model Name or Number:	Headset
Serial Number:	HDE-2
Cable Length And Type:	108 cm
Connected to Port:	Not Stated by Applicant

Test Of: Nokia UK Ltd.

Cameron Imaging Phone 3650 (NHL-8) Mobile Phone Handset (Bluetooth Mode)

To: F.C.C. Part 15 Subpart C: 2001 (Intentional Radiators) Section 15.247

3. Test Specification, Methods And Procedures

3.1. Test Specification

Reference:	FCC Part 15 Subpart C: 2001 (Section 15.247)
Title:	Code of Federal Regulations, Part 15 (47CFR15) Radio Frequency Devices: Digital Devices.
Comments:	A description of the test facility used for this test is on file with, and has been accepted by, the Federal Communications Commission as required by Section 2.948 of Federal Rules.
Purpose of Test:	To determine whether the equipment complied with the requirements of the specification for the purposes of certification.

Reference:	FCC Part 15 Subpart B: 2001 (Section 15.107 and 15.109)
Title:	Code of Federal Regulations, Part 15 (47CFR15) Radio Frequency Devices: Radio Frequency Devices.
Comments:	A description of the test facility used for this test is on file with, and has been accepted by, the Federal Communications Commission as required by Section 2.948 of Federal Rules.
Purpose of Test:	To determine whether the equipment complied with the requirements of the specification for the purposes of certification.

Test Of: Nokia UK Ltd.

Cameron Imaging Phone 3650 (NHL-8) Mobile Phone Handset (Bluetooth Mode)

To: F.C.C. Part 15 Subpart C: 2001 (Intentional Radiators) Section 15.247

3.2. Methods And Procedures

The methods and procedures used were as detailed in:

FCC Code of Federal Regulations 47.

Telecommunication. Parts 0 to 19, October 2001.

ANSI C63.2 (1987)

Title: American National Standard for Instrumentation - Electromagnetic noise and field strength.

ANSI C63.4 (2001)

Title: American National Standard Methods of Measurement of Electromagnetic Emissions from Low Voltage Electrical and Electronic Equipment in the Range of 9 kHz to 40 GHz.

ANSI C63.5 (1988)

Title: American National Standard for the Calibration of antennas used for Radiated Emission measurements in Electromagnetic Interference (EMI) control.

ANSI C63.7 (1988)

Title: American National Standard Guide for Construction of Open Area Test Sites for performing Radiated Emission Measurements.

CISPR 16-1: (1999)

Title: Specification For Radio Disturbance and Immunity Measuring Apparatus and Methods. Part 1: Radio Disturbance and Immunity Measuring Apparatus.

3.3. Definition Of Measurement Equipment

The measurement equipment used complied with the requirements of the standards referenced in the Methods & Procedures section above. Appendix 1 contains a list of the test equipment used.

Test Of: Nokia UK Ltd.

Cameron Imaging Phone 3650 (NHL-8) Mobile Phone Handset (Bluetooth Mode)

To: F.C.C. Part 15 Subpart C: 2001 (Intentional Radiators) Section 15.247

4. Deviations From The Test Specification

None.

Test Of: Nokia UK Ltd.

Cameron Imaging Phone 3650 (NHL-8) Mobile Phone Handset (Bluetooth Mode)

To: F.C.C. Part 15 Subpart C: 2001 (Intentional Radiators) Section 15.247

5. Operation Of The EUT During Testing

5.1. Operating Conditions

The EUT was tested in a normal laboratory environment.

During testing, the EUT was powered by a 110 V, 60 Hz AC Mains supply.

5.2. Operating Modes

The EUT was tested in the following operating modes:

Bluetooth mode Transmitting on Top, Middle, Bottom channels or in receive mode.

The reason for choosing these modes was that the client defined it as being likely to be the worst case with regards EMC.

5.3. Configuration And Peripherals

The EUT was tested in the following configuration:

Configured with hands free kit, AC battery charger and internal battery.

A link was established and channels selected using the CMU200 Bluetooth test set.

Test Of: Nokia UK Ltd.

Cameron Imaging Phone 3650 (NHL-8) Mobile Phone Handset (Bluetooth Mode)

To: F.C.C. Part 15 Subpart C: 2001 (Intentional Radiators) Section 15.247

6. Summary Of Test Results

Range Of Measurements	Specification Reference	Port Type	Compliance Status
Receiver Conducted Emissions (AC Mains)	C.F.R. 47 FCC Part 15: 2001 Section 15.107	AC Mains Terminals	Complied
Receiver Radiated Emissions	C.F.R. 47 FCC Part 15: 2001 Section 15.109	Antenna	Complied
Transmitter Conducted Emissions (AC Mains)	C.F.R. 47 FCC Part 15: 2001 Section 15.207	AC Mains Terminals	Complied
Transmitter Carrier Frequency Separation	C.F.R. 47 FCC Part 15: 2001 Section 15.247(a)(1)	Antenna Terminals	Complied
Transmitter 20dB Bandwidth	C.F.R. 47 FCC Part 15: 2001 Section 15.247(a)(1)	Antenna Terminals	Complied
Transmitter Average Time of Occupancy	C.F.R. 47 FCC Part 15: 2001 Section 15.247(a)(1)(iii)	Antenna Terminals	Complied
Transmitter Maximum Peak Output Power	C.F.R. 47 FCC Part 15: 2001 Section 15.247(b)(1)	Antenna Terminals	Complied
Transmitter Conducted Emissions	C.F.R. 47 FCC Part 15: 2001 Section 15.247 (c)	Antenna Terminals	Complied
Transmitter Radiated Emissions	C.F.R. 47 FCC Part 15: 2001 Section 15.247(c) Section 15.209(a)	Antenna	Complied
Transmitter Band Edge Conducted Emissions	CFR 47: 2001, Section 15.247(c)	Antenna Terminals	Complied
Transmitter Band Edge Radiated Emission	CFR 47: 2001, Section 15.247(c) Section 15.209(a)	Antenna	Complied

6.1. Location Of Tests

All the measurements described in this report were performed at the premises of Radio Frequency Investigation Ltd, Ewhurst Park, Ramsdell, Basingstoke, Hampshire, RG26 5RQ, England.

Test Of: Nokia UK Ltd.

Cameron Imaging Phone 3650 (NHL-8) Mobile Phone Handset (Bluetooth Mode)

To: F.C.C. Part 15 Subpart C: 2001 (Intentional Radiators) Section 15.247

7. Measurements, Examinations And Derived Results

7.1. General Comments

7.1.1. This section contains test results only. Details of the test methods and procedures can be found in Appendix 2 of this report.

7.1.2. Measurement uncertainties are evaluated in accordance with current best practice. Our reported expanded uncertainties are based on standard uncertainties, which are multiplied by an appropriate coverage factor to provide a statistical confidence level of approximately 95%. Please refer to Section 8 for details of measurement uncertainties.

Test Of: Nokia UK Ltd.

Cameron Imaging Phone 3650 (NHL-8) Mobile Phone Handset (Bluetooth Mode)

To: F.C.C. Part 15 Subpart C: 2001 (Intentional Radiators) Section 15.247

7.2. Receiver Conducted Emissions: AC Mains - Section 15.107**7.2.1. Quasi-Peak Detector Measurements On Live And Neutral Lines**

7.2.1.1. Preliminary AC conducted spurious scans were performed with the EUT set to receive mode.

7.2.1.2. Final measurements were performed on the worst-case configuration as described in Part 15.31(i).

7.2.1.3. Plots of all the initial scans can be found in Appendix 4.

7.2.1.4. The following tables lists frequencies at which emissions were measured using a Quasi-Peak and Average detector:

Quasi-Peak Detector Measurements on Live and Netral Lines

Frequency (MHz)	Line	Q-P Level (dB μ V)	Q-P Limit (dB μ V)	Margin (dB)	Result
4.13628	Neutral	21.14	56.00	34.86	Complied
4.38018	Live	21.47	56.00	34.53	Complied

Average Detector Measurements on Live and Netral Lines

Frequency (MHz)	Line	Q-P Level (dB μ V)	Q-P Limit (dB μ V)	Margin (dB)	Result
4.13628	Neutral	16.59	46.00	29.41	Complied
4.38018	Live	16.21	46.00	29.79	Complied

Test Of: Nokia UK Ltd.

Cameron Imaging Phone 3650 (NHL-8) Mobile Phone Handset (Bluetooth Mode)

To: F.C.C. Part 15 Subpart C: 2001 (Intentional Radiators) Section 15.247

7.3. Receiver Radiated Emissions: Section 15.109**7.3.1. Electric Field Strength Measurements (Frequency Range: 30 to 1000 MHz)**

7.3.1.1. The EUT was operated in receive mode to the limits specified in Part 15.109.

7.3.1.2. Preliminary Radiated spurious scans were performed with the EUT set to Receive Mode, as stated in section 5.2. Final measurements were made on any visible spurious that were within 20 dB of the limit.

7.3.1.3. Plots of the initial scans can be found in Appendix 4.

Frequency (MHz)	Ant. Pol.	Q-P Level (dB μ V/m)	Limit (dB μ V/m)	Margin (dB)	Result
553.996	Vert	23.8	46.0	22.0	Complied

Test Of: Nokia UK Ltd.

Cameron Imaging Phone 3650 (NHL-8) Mobile Phone Handset (Bluetooth Mode)

To: F.C.C. Part 15 Subpart C: 2001 (Intentional Radiators) Section 15.247

7.4. Receiver Radiated Emissions: Section 15.109**7.4.1. Electric Field Strength Measurements (Frequency Range: 1.0 to 26.5 GHz)**

7.4.1.1. Tests were performed up to five times the highest generated clock frequency.

7.4.1.2. Preliminary Radiated spurious scans were performed with final measurements being taken for any emission within 20dB of the limit.

7.4.1.3. Due to dynamic range limitations of the measuring receiver, scans at high frequencies above 12 GHz were performed at 1 metre measurement distances, with an corrected limit line for the reduced test distances.

7.4.1.4. Plots of all the initial scans can be found in Appendix 4.

7.4.1.5. The following table indicates results or the EUT configured with an internal antenna connected and operating.

Highest Average Level:

Frequency (GHz)	Antenna Polarity (H/V)	Average Detector level (dB μ V)	Antenna factor (dB)	Cable loss (dB)	Actual Average Level (dB μ V/m)	Average Limit (dB μ V/m)	Average Margin (dB)	Result
4.526	Vert	7.6	24.1	1.5	33.2	54	20.8	Complied

Highest Peak Level:

Frequency (GHz)	Antenna Polarity (H/V)	Peak Detector level (dB μ V)	Antenna factor (dB)	Cable loss (dB)	Actual Peak Level (dB μ V/m)	Peak Limit (dB μ V/m)	Peak Margin (dB)	Result
4.526	Vert	7.6	24.1	1.5	42.7	74	31.3	Complied

To: F.C.C. Part 15 Subpart C: 2001 (Intentional Radiators) Section 15.247

7.5. Transmitter Conducted Emissions: AC Mains - Section 15.207**7.5.1. Quasi-Peak Detector Measurements On Live And Neutral Lines**

7.5.1.1. Preliminary conducted spurious scans were performed with the EUT set to Top, Middle, Bottom as requested in FCC Part 15.31(m).

7.5.1.2. Final measurements were then performed on the worst-case configuration as described in Part 15.31(i).

7.5.1.3. Plots of all the initial scans can be found in Appendix 4.

7.5.1.4. The following table lists frequencies at which emissions were measured using a Quasi-Peak detector:

Quasi-Peak Detector Measurements on Live and Netral Lines**Bottom Channel**

Frequency (MHz)	Line	Q-P Level (dB μ V)	Q-P Limit (dB μ V)	Margin (dB)	Result

Test Of: Nokia UK Ltd.

Cameron Imaging Phone 3650 (NHL-8) Mobile Phone Handset (Bluetooth Mode)

To: F.C.C. Part 15 Subpart C: 2001 (Intentional Radiators) Section 15.247

7.6. Transmitter Carrier Frequency Separation: Section 15.247(a)(1)

7.6.1. Tests were performed to identify the carrier frequency separation as per FCC Part 15.247(a)(1).

7.6.2. Section 15.247 (a)(1) specifies that the channels should be separated by at least 25kHz or the 20dB bandwidth of the channel.

7.6.3. The following table shows the measured Carrier Frequency Separation with reference to a graphical plot in appendix 4 of this report:

Result:

Transmitter Carrier Frequency Separation (kHz)	Graph
1000	GPH/44367JD01/A001 Appendix 4

Test Of: Nokia UK Ltd.**Cameron Imaging Phone 3650 (NHL-8) Mobile Phone Handset (Bluetooth Mode)****To: F.C.C. Part 15 Subpart C: 2001 (Intentional Radiators) Section 15.247**

7.7.Transmitter 20dB Bandwidth: Section 15.247(a)(1)

7.7.1. Tests were performed to identify the 20dB bandwidth as per FCC Part 15.247(a)(1).

7.7.2. The following table shows the measured 20 dB bandwidth with reference to a graphical plot in appendix 4 of this report:

Result:

Transmitter 20dB Bandwidth (kHz)	Graph
657.314	GPH/44367JD01/A006 Appendix 4

Test Of: Nokia UK Ltd.**Cameron Imaging Phone 3650 (NHL-8) Mobile Phone Handset (Bluetooth Mode)****To: F.C.C. Part 15 Subpart C: 2001 (Intentional Radiators) Section 15.247**

7.8.Transmitter Average Time of Occupancy: Section 15.247(a)(1)(iii)

7.8.1. Tests were performed to identify the average time occupancy as per FCC Part 15.247(a)(1)(iii).

7.8.2. Section 15.247 (a)(1)(iii) specifies that the average time occupancy shall not be greater than 0.4 seconds.

7.8.3. The time occupancy of the system was tested on a single carrier. The maximum packet length was measured and multiplied by the number of transmissions within a 30 second period. The result was noted as being the average time of occupancy and can be seen in the following table with references the a graphical plot in appendix 4 of this report:

Result:

Packet Width (μs)	Number of Transmissions in 30 Seconds	Average Time of Occupancy (s)	Graph
440.882	244	0.107575	GPH/44367JD01/A003 Appendix 4 GPH/44367JD01/A004 Appendix 4

Test Of: Nokia UK Ltd.

Cameron Imaging Phone 3650 (NHL-8) Mobile Phone Handset (Bluetooth Mode)

To: F.C.C. Part 15 Subpart C: 2001 (Intentional Radiators) Section 15.247

7.9. Transmitter Peak Output Power: Section 15.247(b)(1)

7.9.1. Tests were performed to identify the maximum transmit power in accordance with FCC Part 15.247(b)(1).

7.9.2. The client has provided a temporary antenna port to allow a direct connection to be made.

7.9.3. The client has specified that the EUT employs frequency hopping with 79 hopping channels. Therefore the maximum transmitter power level under FCC Part 15.247(b)(1) is 1 Watt.

7.9.4. Results are shown for the EUT set to Top, Middle and Bottom channels as stated in FCC Part 15.31 (m) and section 5.2 of this report. Graphical measurements are shown for the transmit power levels within Appendix 4.

7.9.5. Measurements were performed on the Top, Middle and Bottom channels for the specified extremes of input voltages:

Results:

Number of Hopping Channels Employed	Graph
79	GPH/44367D01/A002 Appendix 4

Channel	Input Voltage (AC)	Maximum Transmitter Conducted Output Level (Watts)	Antenna Gain (dBi)	EIRP (Watts)	Limit (Watts)	Margin (dB)	Result
Bottom	93.5	0.000875	-1.0	0.000695	1.0	0.999125	Complied
Bottom	110.0	0.000927	-1.0	0.000736	1.0	0.999073	Complied

Test Of: Nokia UK Ltd.

Cameron Imaging Phone 3650 (NHL-8) Mobile Phone Handset (Bluetooth Mode)

To: F.C.C. Part 15 Subpart C: 2001 (Intentional Radiators) Section 15.247

7.10. Transmitter Conducted Emissions: Section 15.247(c)

7.10.1. Spurious emissions tests on the antenna port were performed in accordance with FCC Part 15.247(c).

7.10.2. Section 15.247(c) specifies that all spurious emissions measured within a 100 kHz bandwidth shall be attenuated by at least 20 dB below the level of the highest fundamental level measured in a 100 kHz bandwidth.

7.10.3. Conducted spurious emission scans were performed between 30MHz to 10 times the highest generated frequency with the EUT operating at the Top, Middle, Bottom channels as specified within clause 15.31(m). All channels were active and transmitting data.

7.10.4. Plots of the initial scans can be found in Appendix 4.

Results:**Highest Peak Level: Bottom**

Frequency (GHz)	Peak Detector level (dBm)	Peak Limit (dBm)	Peak Margin (dB)	Result
2.2894	-40.50	20.67	19.83	Complied

7.11. Transmitter Radiated Emissions: Section 15.247(c) and 15.209(a)**7.11.1. Electric Field Strength Measurements: 30 to 1000 MHz.**

7.11.1.1. The following table specifies frequencies, which fall close to the restricted bands as specified in section 15.205(a).

7.11.1.2. The client has stated that the highest clock frequency for the EUT was 2.480GHz. Therefore measurements were performed up to 26 GHz.

7.11.1.3. Preliminary Radiated spurious scans were performed with the EUT set to Top, Middle and Bottom channels and with all channels active (transmitting data on pseudo random hopping channels) as stated in section 5.2.

7.11.1.4. Due to dynamic range limitations of the measuring receiver, scans at high frequencies above 12 GHz were performed at a 1 metre measurement distance. The measured value was then corrected by 9.5 dB using the formula $20\log(D1/D2)$ Where D1 was 3 meters and D2 was 1 meter.

7.11.1.5. Plots of the initial scans can be found in Appendix 4.

7.11.1.6. The following table lists frequencies at which emissions were measured using a Quasi-Peak detector at a test distance of 3m (results incorporate antenna factors and cable losses):

7.11.1.7. The following results are for the EUT configured with an internal antenna connected and operating.

Bottom Channel

Frequency (MHz)	Ant. Pol.	Q-P Level (dB μ V/m)	Limit (dB μ V/m)	Margin (dB)	Result
332.169	Hor	33.8	46.0	12.2	Complied
597.904	Hor	31.9	70.4	38.5	Complied
400.000	Hor	30.9	46.0	15.1	Complied
960.000	Ver	37.8	46.0	8.2	Complied

Note: The preliminary scans showed similar emission levels for each mode below 1 GHz, therefore final radiated emissions measurements were performed with the EUT set to the Middle channel only.

7.12. Transmitter Band Edge Conducted Emissions FCC 15.247(c)

7.12.1. The EUT and spectrum analyser were configured as for conducted antenna port measurements, and as per FCC Public Notice DA 00-705, Filing and Measurement Guidelines for Frequency Hopping Spread Spectrum Systems.

7.12.2. The applicant to allow for conducted measurements provided a temporary antenna port.

7.12.3. A plot of the upper channel and the protected band closest to the upper channel was produced. A marker was set to the peak of the highest channel and a delta marker set to the highest out of band peak. (The specification states that either the band edge level must be measured or the highest out of band emission, whichever is greater). The plots show that the emission complies with the 20dBc limit.

7.12.4. A plot of the lower channel and the protected band closest to the lower channel was produced. A marker was set to the peak of the lowest channel and a delta marker set to the highest out of band peak. (The specification states that either the band edge level must be measured or the highest out of band emission, whichever is greater). The plots show that the emission complies with the 20dBc limit.

7.12.5. Two graphs in total were produced, with the device set to top and bottom channels. The plots can be seen in appendix 4 of this report.

Highest Peak Level Lower Band Edge

8. Measurement Uncertainty

8.1. No measurement or test can ever be perfect and the imperfections give rise to error of measurement in the results. Consequently, the result of a measurement is only an approximation to the value of the measurand (the specific quantity subject to measurement) and is only complete when accompanied by a statement of the uncertainty of the approximation.

8.2. The expression of uncertainty of a measurement result allows realistic comparison of results with reference values and limits given in specifications and standards.

8.3. The uncertainty of the result may need to be taken into account when interpreting the measurement results.

8.4. The reported expanded uncertainties below are based on a standard uncertainty multiplied by an appropriate coverage factor, such that a confidence level of approximately 95% is maintained. For the purposes of this document "approximately" is interpreted as meaning "effectively" or "for most practical purposes".

Measurement Type	Range	Confidence Level (%)	Calculated Uncertainty
Conducted Emissions AC Mains	0.15 MHz to 30 MHz	95%	+/- 3.25 dB
Time Occupancy	Not applicable	95%	+/- 10 %
Channel Separation	Not applicable	95%	+/- 10 %
Occupied Bandwidth	1850 to 1910 MHz	95%	+/- 0.12 %
Effective Isotropic Radiated Power	1.0 GHz to 26 GHz	95%	+/- 1.78 dB
Radiated Emissions at 3.0 metres	30 MHz to 1000 MHz	95%	+/- 5.26 dB
Conducted Emissions Antenna Port	0.009 kHz to 26 GHz	95%	+/- 1.2 dB
Radiated Emissions at 3.0 metres	1 GHz to 26 GHz	95%	+/- 1.78 dB

8.5. The methods used to calculate the above uncertainties are in line with those recommended within the various measurement specifications. Where measurement specifications do not include guidelines for the evaluation of measurement uncertainty, the published guidance of the appropriate accreditation body is followed.

Appendix 2. Measurement Methods

AC Mains Conducted Emissions

AC mains conducted emissions measurements were performed in accordance with the standard, against appropriate limits for each detector function.

The test was performed in a shielded enclosure with the equipment arranged as detailed in the standard on a wooden bench using the floor of the screened enclosure as the ground reference plane and with the EUT powered via a 60 Hz AC mains supply.

Initial measurements in the form of swept scans covering the entire measurement band were performed in order to identify frequencies on which the EUT was generating interference. In order to minimise the time taken for these swept measurements, a Peak detector was used in conjunction with the appropriate detector IF measuring bandwidths (see table below). Repetitive scans were performed to allow for emissions with low repetition rates, and the duty cycle of the EUT. The test configuration was the same for the initial scans as for the final measurements.

Following the initial scans, a graph was produced giving an overview of the emissions from the EUT plotted against the appropriate specification limit. A tolerance line was set 6 dB below the specification limit and levels above the tolerance line were re-tested (at individual frequencies) using the appropriate detector function.

The test equipment settings for conducted emissions measurements were as follows:

Receiver Function	Initial Scan	Final Measurements
Detector Type:	Peak	Quasi-Peak (CISPR)*
Mode:	Max Hold	Not applicable
Bandwidth:	9 kHz	9 kHz
Amplitude Range:	60 dB	20 dB
Measurement Time:	Not applicable	> 1 s
Observation Time:	Not applicable	> 15 s
Step Size:	Continuous sweep	Not applicable
Sweep Time:	Coupled	Not applicable

* In some instances an Average detector function may also have been used.

Test Of: Nokia UK Ltd.**Cameron Imaging Phone 3650 (NHL-8) Mobile Phone Handset (Bluetooth Mode)****To: F.C.C. Part 15 Subpart C: 2001 (Intentional Radiators) Section 15.247**

Radiated Field Strength Emissions

Radiated emissions measurements were performed in accordance with the standard, against appropriate limits for each detector function.

Initial measurements covering the entire measurement band in the form of swept scans in a shielded enclosure were performed in order to identify frequencies on which the EUT was generating interference. This determined the frequencies on which the EUT should be re-measured in full on the open area test site. In order to minimise the time taken for the swept measurements, a Peak detector was used in conjunction with the appropriate detector IF measuring bandwidth (see table below). Repetitive scans were performed to allow for emissions with low repetition rates, and for the duty cycle of the EUT. The test configuration was the same for the initial scans as for the final measurements.

The initial scans were performed using an antenna height of 1.5 m and a measurement distance of 3 m. Following the initial scans, graphs were produced giving an overview of the emissions from the EUT plotted against the appropriate specification limit. A tolerance line was set 6 dB below the specification limit and levels above the tolerance line were re-tested on the open area test site, at the appropriate distance, using a measuring receiver with a Quasi-Peak (below 1000 MHz), Average and Peak (above 1000 MHz) detector, where applicable.

For the main (final) measurements the EUT was arranged on a non-conducting table on an open area test site, as detailed in the specification.

All measurements on the open area test site were performed using broadband antennas.

On the open area test site, at each frequency where a signal was found, the levels were maximised by initially rotating the turntable through 360°. For frequencies below 1000 MHz, the antenna was varied in height between 1 m and 4 m. For frequencies above 1000 MHz, the antenna was fixed at a height of 1.5m. At this point, any signals found to be between the limit and a level 6 dB below it were further maximised by changing the configuration of the EUT, e.g. re-routing cables to peripherals and moving peripherals with respect to the EUT.

Once the signal amplitude is determined the EUT is replaced with a substitution antenna. A signal generator is connected to the antenna and its level adjusted in order to obtain the same indicated level as that which was observed from the EUT. The receive antenna is then adjusted in height until the signal measured has peaked. The signal generator level is then re-adjusted to regain the original reading. The level on the signal generator – cable losses plus the antenna gain is the recorded ERP.

Conducted Antenna Port Emissions

Conducted Antenna Port Emissions measurements were performed in accordance with the standard, against appropriate limits for each detector function.

Prior to testing being performed a suitable RF attenuator and cable were calibrated for the required frequency range. For each measurement range performed, the calibrated level of the attenuator and cable were entered as an offset into the spectrum analyser to compensate for the measurement setup.

Initial measurements covering the entire measurement band in the form of swept scans were performed in order to identify frequencies on which the EUT was generating interference. This determined the frequencies on which measurements were performed. In order to minimise the time taken for the swept measurements, a Peak detector was used in conjunction with the appropriate detector IF measuring bandwidth (see table below). Repetitive scans were performed to allow for emissions with low repetition rates, and for the duty cycle of the EUT. The test configuration was the same for the initial scans as for the final measurements.

Due to the design of the EUT, conducted antenna port measurements were common for both the internal and external antenna connection.

To determine the transmitter output power, the EUT was operated as intended with the spectrum analyser operated in a maximum hold mode over the full operating frequency range of the EUT to identify the highest emission within the band.

To determine spurious emissions levels, the EUT was operated as intended with the spectrum analyser operated in a maximum hold mode over selected frequency ranges between 30 MHz and 26 GHz. A reference limit line of 20dB below the maximum output of the transmitter was noted. Levels within 20dB of this limit line were then recorded.

Test Of: Nokia UK Ltd.

To: F.C.C. Part 15 Subpart C: 2001 (Intentional Radiators) Section 15.247

Channel Separation FCC 15.247(1)

The EUT and spectrum analyser was configured as for conducted antenna port measurements, And as per FCC Public Notice DA 00-705, Filing and Measurement Guidelines for Frequency Hopping Spread Spectrum Systems.

To determine the bandwidth and separation of each transmission channel the analyser was configured to measure two adjacent channels.

To determine the occupied bandwidth, A resolution bandwidth of 10 kHz was used, which is greater than 1% of the 20 dB bandwidth. A video bandwidth of a least the same value was used. The analyser was set for a maximum hold scan to capture the profile of the signal. The peak level was then determined, and a reference line was drawn 20dB below the peak level. The bandwidth was determined at the points where the 20dB reference crossed the profile of the emission.

Test Of: Nokia UK Ltd.

Cameron Imaging Phone 3650 (NHL-8) Mobile Phone Handset (Bluetooth Mode)

To: F.C.C. Part 15 Subpart C: 2001 (Intentional Radiators) Section 15.247

Occupied Bandwidth FCC 15.247(1)

For channel separation, the analyser was configured with a resolution bandwidth and video bandwidth of at least 1% of the frequency span set on the analyser. The EUT was operated as intended and the analyser set to a maximum hold mode scan to capture the profile of the signals.

The peak points on the two adjacent channels were noted and the separation between them recorded.

The channel separation was then determined as the greater of 25kHz or the 20dB bandwidth.

Test Of: Nokia UK Ltd.

To: F.C.C. Part 15 Subpart C: 2001 (Intentional Radiators) Section 15.247

Average Time of Occupancy FCC 15.247(1)(ii)

The EUT and spectrum analyser was configured as for conducted antenna port measurements

To determine the maximum packet length on any given channel, the analyser was configured in the time domain mode and the EUT was configured to operate as intended.

To determine the average occupancy time on any given channel the analyser was configured in the time domain and a 30 second sweep carried out. The number of times the channel was occupied in any 30 second period multiplied by the maximum packet length will give the total time on the given channel.

Test Of: Nokia UK Ltd.

Cameron Imaging Phone 3650 (NHL-8) Mobile Phone Handset (Bluetooth Mode)

To: F.C.C. Part 15 Subpart C: 2001 (Intentional Radiators) Section 15.247

Number Of Hopping Frequencies FCC 15.247(a)(1)(ii)

The EUT and spectrum analyser was configured as for conducted antenna port measurements, And as per FCC Public Notice DA 00-705, Filing and Measurement Guidelines for Frequency Hopping Spread Spectrum Systems.

To determine the number of hopping frequencies the EUT was set to operate in its normal mode of operation, hopping over all channels that it is intended to operate on.

The spectrum analyser had a span set to cover the frequency band of operation. The resolution bandwidth was set to $\geq 1\%$ of the span. The video bandwidth was set to be no less than the resolution bandwidth. The sweep was set to auto, the detector function to peak and trace to max hold. This test was also performed with the span set to the lower half the operating frequency range and then to the upper half of the operating frequency range for better resolution.

Test Of: Nokia UK Ltd.

To: F.C.C. Part 15 Subpart C: 2001 (Intentional Radiators) Section 15.247

Peak Output Power FCC 15.247(b)

The EUT and spectrum analyser was configured as for conducted antenna port measurements, And as per FCC Public Notice DA 00-705, Filing and Measurement Guidelines for Frequency Hopping Spread Spectrum Systems.

The applicant to allow for conducted measurements provided a temporary antenna port.

As the frequency range of operation was greater than 10 MHz, The test was performed on the BOTTOM, MIDDLE and TOP channels as per FCC 15.31(m).

The tests were performed at extremes of voltage of +/- 15%. The test was also performed at 240 Volts + 15% at the applicants request.

The analyser was setup as per FCC Public Notice DA 00-705.

Test Of: Nokia UK Ltd.**Cameron Imaging Phone 3650 (NHL-8) Mobile Phone Handset (Bluetooth Mode)****To: F.C.C. Part 15 Subpart C: 2001 (Intentional Radiators) Section 15.247**

Band Edge Compliance of RF Conducted Emissions FCC 15.247(c)

The EUT and spectrum analyser was configured as for conducted antenna port measurements, And as per FCC Public Notice DA 00-705, Filing and Measurement Guidelines for Frequency Hopping Spread Spectrum Systems.

A temporary antenna port was provided by the applicant to allow for conducted measurements.

To determine band-edge compliance, the analyser bandwidth resolution bandwidth was set to $\geq$ the analyser span. The video bandwidth was set to be no less than the resolution bandwidth. The sweep was set to auto and the detector to peak. The trace was set to max hold and a trace was produced.

A Plot of the upper channel and the protected band closest to the upper channel was produced. A marker was set to the peak of the highest channel and a delta marker set to the highest out of band peak. (The specification states that either the band edge level must be measured or the highest out of band emission. Which ever is greater). The plots show that the emission complies with the 20 dBc limit.

A Plot of the lower channel and the protected band closest to the lower channel was produced. A marker was set to the peak of the lowest channel and a delta marker set to the highest out of band peak. (The specification states that either the band edge level must be measured or the highest out of band emission. Which ever is greater). The plots show that the emission complies with the 20 dBc limit.

Four plots were produced, Two times top and bottom channels with hopping on and two time top and bottom channels with hopping off.
