Deviations From Test Standards

None

Approved By:

Kyle Holgate, Operations Manager

Product compliance is the responsibility of the client; therefore, the tests and equipment modes of operation represented in this report were agreed upon by the client, prior to testing. The results of this test pertain only to the sample(s) tested. The specific description is noted in each of the individual sections of the test report supporting this certificate of test. This report reflects only those tests from the referenced standards shown in the certificate of test. It does not include inspection or verification of labels, identification, marking or user information. As indicated in the Statement of Work sent with the quotation, Element's standard process is to always use the latest published version of the test methods even when earlier versions are cited in the test specification. Issuance of a purchase order was de facto acceptance of this approach. Otherwise, the client would have advised Element in writing of the specific version of the test methods they wanted applied to the subject testing.

REVISION HISTORY

Revision Number	Description	Date (yyyy-mm-dd)	Page Number
01	Added Model 2100 Wireless Transmitter to the EUT name	2021-12-16	All pages
01	Updated the following data: Emissions Bandwidth, Emissions Mask, Conducted Output Power, Radiated Power (EIRP)	2021-12-16	13-20, 22-24, 45-47
02	Added additional Spurious Radiated Emissions Data, and updated the test equipment.	2021-12-22	37, 40-41

ACCREDITATIONS AND AUTHORIZATIONS

United States

FCC - Designated by the FCC as a Telecommunications Certification Body (TCB). Certification chambers, Open Area Test Sites, and conducted measurement facilities are listed with the FCC.

A2LA - Each laboratory is accredited by A2LA to ISO / IEC 17025, and as a product certifier to ISO / IEC 17065 which allows Element to certify transmitters to FCC and IC specifications.

Canada

ISED - Recognized by Innovation, Science and Economic Development Canada as a Certification Body (CB) and as a CAB for the acceptance of test data.

European Union

European Commission – Recognized as an EU Notified Body validated for the EMCD and RED Directives.

United Kingdom

BEIS – Recognized by the UK as an Approved Body under the UK Radio Equipment and UK EMC Regulations.

Australia/New Zealand

ACMA - Recognized by ACMA as a CAB for the acceptance of test data.

Korea

MSIT / RRA - Recognized by KCC's RRA as a CAB for the acceptance of test data.

Japan

VCCI - Associate Member of the VCCI. Conducted and radiated measurement facilities are registered.

Taiwan

BSMI – Recognized by BSMI as a CAB for the acceptance of test data.

NCC - Recognized by NCC as a CAB for the acceptance of test data.

Singapore

IDA – Recognized by IDA as a CAB for the acceptance of test data.

Israel

MOC – Recognized by MOC as a CAB for the acceptance of test data.

Hong Kong

OFCA – Recognized by OFCA as a CAB for the acceptance of test data.

Vietnam

MIC – Recognized by MIC as a CAB for the acceptance of test data.

MEASUREMENT UNCERTAINTY

Measurement Uncertainty

When a measurement is made, the result will be different from the true or theoretically correct value. The difference is the result of tolerances in the measurement system that cannot be completely eliminated. To the extent that technology allows us, it has been our aim to minimize this error. Measurement uncertainty is a statistical expression of measurement error qualified by a probability distribution.

A measurement uncertainty estimation has been performed for each test per our internal quality document QM205.4.6. The estimation is used to compare the measured result with its "true" or theoretically correct value. The expanded measurement uncertainty (K=2) can be found in the table below. A lab specific value may also be found in the applicable test description section. Our measurement data meets or exceeds the measurement uncertainty requirements of the applicable specification; therefore, the test data can be compared directly to the specification limit to determine compliance. The calculations for estimating measurement uncertainty are based upon ETSI TR 100 028 (or CISPR 16-4-2 as applicable), and are available upon request.

The following table represents the Measurement Uncertainty (MU) budgets for each of the tests that may be contained in this report.

Test	+ MU	- MU
Frequency Accuracy	0.0007%	-0.0007%
Amplitude Accuracy (dB)	1.2 dB	-1.2 dB
Conducted Power (dB)	1.2 dB	-1.2 dB
Radiated Power via Substitution (dB)	0.7 dB	-0.7 dB
Temperature (degrees C)	0.7°C	-0.7°C
Humidity (% RH)	2.5% RH	-2.5% RH
Voltage (AC)	1.0%	-1.0%
Voltage (DC)	0.7%	-0.7%
Field Strength (dB)	5.2 dB	-5.2 dB
AC Powerline Conducted Emissions (dB)	3.2 dB	-3.2 dB

TEST SETUP BLOCK DIAGRAMS

Measurement Bandwidths

Frequency Range (MHz)	Peak Data (kHz)	Quasi-Peak Data (kHz)	Average Data (kHz)
0.01 - 0.15	1.0	0.2	0.2
0.15 - 30.0	10.0	9.0	9.0
30.0 - 1000	100.0	120.0	120.0
Above 1000	1000.0	N/A	1000.0

Unless otherwise stated, measurements were made using the bandwidths and detectors specified. No video filter was used.

Antenna Port Conducted Measurements

Sample Calculation (logarithmic units)

Measured Value		Measured Level		Reference Level Offset
71.2	=	42.6	+	28.6

Near Field Test Fixture Measurements

	Transducer Factor	Cable Factor		
26.7	0.3	0.1	20.0	47.1

TEST SETUP BLOCK DIAGRAMS

Bore Sighting (>1GHz)

The diameter of the illumination area is the dimension of the line tangent to the EUT formed by 3 dB beamwidth of the measurement antenna at the measurement distance. At a 3 meter test distance, the diameter of the illumination area was 3.8 meters at 1 GHz and greater than 2.1 meters up to 6 GHz. Above 1 GHz, when required by the measurement standard, the antenna is pointed for both azimuth and elevation to maintain the receive antenna within the cone of radiation from the EUT. The specified measurement detectors were used for comparison of the emissions to the peak and average specification limits.

PRODUCT DESCRIPTION

Client and Equipment Under Test (EUT) Information

Company Name:	MicroTransponder, Inc.
Address:	2802 Flintrock Trace Ste 226
City, State, Zip:	Austin, TX 78738
Test Requested By:	Chester Buress
EUT:	Model 2100 Wireless Transmitter
First Date of Test:	October 19, 2021
Last Date of Test:	December 10, 2021
Receipt Date of Samples:	October 14, 2021
Equipment Design Stage:	Prototype
Equipment Condition:	No Damage
Purchase Authorization:	Verified

Information Provided by the Party Requesting the Test

Functional Description of the EUT:

The Wolfgang System is a medical system for the treatment of Stroke. It is composed of an implantable device, the Wolfgang Implantable Pulse Generator (IPG), the Wolfgang Programmer Interface (PI) and the Stroke Application and Programming Software (SAPS). The Wolfgang PI, connected to the Laptop, is used to coordinate the stimulation by communicating wirelessly with the implant. The Wolfgang Programmer Interface and the Stroke Application and Programming Software are products designed and manufactured by CCC. The Laptop is an off-the-shelf device, selected by MTI, which comply with applicable IEC/ISO safety standards. These components shall be configured as a system and tested per this test plan.

Testing Objective:

Seeking FCC authorization for the MedRadio transmitter to FCC Part 95I.

POWER SETTINGS AND ANTENNAS

The power settings, antenna gain value(s) and cable loss (if applicable) used for the testing contained in this report were provided by the customer and will affect the validity of the results. Element assumes no responsibility for the accuracy of this information.

Analyzer - Spectrum Analyzer	Keysight	N9010A	AFO	2021-07-06	2022-07-06

TEST DESCRIPTION

Per 47 CFR 95.2573(a), the emission bandwidth was determined by measuring the width of the signal between two points, one below the carrier center frequency and one above the carrier center frequency, that are 20 dB down relative to the maximum level of the modulated carrier. A spectrum analyzer using a peak detector with no video filtering was used with a resolution bandwidth equal to approximately 1.0 percent of the emission bandwidth of the EUT.

Analyzer - Spectrum Analyzer	Keysight	N9010A	AFO	2021-07-06	2022-07-06

TEST DESCRIPTION

Per 47 CFR 95.2579(a)(1) the emission mask was measured. Emissions more than 150 kHz away from the center frequency must be attenuated below the transmitter output power by at least 20 dB. This was evaluated by the Occupied Bandwidth measurement according to 47 CFR 95.2573(a). In addition, emissions 250 kHz or less above and below the MICS band (402-405 MHz) must be attenuated below the maximum permitted output power by at least 20 dB.

A spectrum analyzer was used to measure the emission mask. A spectrum analyzer using a peak detector with no video filtering was used with a resolution bandwidth equal to approximately 1.0 percent of the emission bandwidth of the EUT. However, various plots were made using different frequency spans and resolution bandwidths in an attempt to not only satisfy the measurement criteria, but to also show that all emissions outside of the occupied band are greatly attenuated.

TEST DESCRIPTION

The Duty Cycle (x) of the single channel operation of the radio as controlled by the provided test software was measured for each of the EUT operating modes.

There is no compliance requirement to be met by this test, so therefore no Pass / Fail criteria.

The measurements were made using a zero span on the spectrum analyzer to see the pulses in the time domain. The transmit power was set to its default maximum.

The duty cycle was calculated by dividing the transmission pulse duration (T) by the total period of a single on and total off time.

If the transmit duty cycle < 98 percent, burst gating may have been used during some of the other tests in this report to only take the measurement during the burst duration.

Analyzer - Spectrum Analyzer	Keysight	N9010A	AFO	2021-07-06	2022-07-06

TEST DESCRIPTION

Per FCC Part 2.1046, the output power shall be measured at the RF terminal. The RMS output power was measured with the EUT configured in the modes listed in the datasheet. The EUT was transmitting at its maximum data rate.

The measurement was performed using ANSI C63.26, clause 5.2.4.3.2 which uses trace averaging followed by a duty cycle correction factor (DCCF).

The analyzer settings were configured as follows:

- Span = 2x to 3x the OBW
- RBW > OBW
- Detector = power average (RMS)
- Trace average = 100 traces

The PK marker function was used to indicate the maximum amplitude level, followed by a DCCF of $10 \cdot \log(1/\text{Duty Cycle})$ to

Testing was performed using the mode(s) of operation and configuration(s) noted within the report. The individuals and/or the organization requesting the test provided the modes, configurations and settings used to complete the evaluation. The actual test parameters are specified in the test data, this includes items such as investigated frequency range (scanned) and test levels. The testing methods and performance specifications, as well as the test site used for the evaluation are indicated in the test data.

Analyzer - Spectrum Analyzer	Keysight	N9010A	AFO	2021-07-06	2022-07-06

TEST DESCRIPTION

The spectrum analyzer is configured with a precision frequency reference that exceeds the stability requirement of the transmitter. The EUT was placed inside a temperature / humidity chamber.

Variation of Supply Voltage

The primary supply voltage was varied from 85% to 115% of the nominal voltage. A DC lab supply was used to vary the supply voltage.

Variation of Ambient Temperature

Using a temperature chamber, the transmit frequency was recorded at the extremes of the specified temperature range 0°C – 55°C

Where a ppm limit applies: $\text{ppm} = (\text{Measured Frequency} / \text{Measured Nominal Frequency} - 1) * 1,000,000$

SPURIOUS RADIATED EMISSIONS

TEST DESCRIPTION

The highest gain of each type of antenna to be used with the EUT was tested. For each configuration, the spectrum was scanned throughout the specified range. While scanning, emissions from the EUT were maximized by rotating the EUT on a turntable, adjusting the position of the EUT and the EUT antenna in three orthogonal axis, and adjusting measurement antenna height and polarization, and manipulating the EUT antenna in 3 orthogonal planes (per ANSI C63.26). A preamp was used for this test in order to provide sufficient measurement sensitivity.

Per CFR 47 95.2579(a), field strength measurements were performed and compared to the specified limits.

TEST DESCRIPTION

Per FCC Part 2.1051, the spurious emissions shall be measured at the RF terminal. The peak spurious emissions were measured with the EUT configured to the modes listed in the datasheet. The EUT was transmitting at its maximum data rate.

FCC Part 95 have no conducted spurious emissions limit. It is a requirement to characterize this information and that data is contained within this datasheet.

SPURIOUS CONDUCTED EMISSIONS

XMIT 2020.12.30.0

EUT: Model 2100 Wireless Transmitter		Work Order: MIER0005	
Serial Number: 0132		Date: 22-Oct-21	
Customer: MicroTransponder, Inc.		Temperature: 22.3 °C	
Attendees: None		Humidity: 45.6% RH	
Project: None		Barometric Pres.: 1012 mbar	
Tested by: Jeff Alcock		Power: USB via 110VAC/60Hz	
		Job Site: EV06	
TEST SPECIFICATIONS		Test Method	
FCC 95I:2021		ANSI C63.26:2015	
COMMENTS			
Reference level offset includes: DC block, 20 dB attenuator, and measurement cable.			
DEVIATIONS FROM TEST STANDARD			
None			
Configuration #	3	Signature 	
		Value (dBm)	Limit
Low Channel, 402.450 MHz			
	9 kHz - 30 MHz	-52.6	N/A
	30 MHz - 1000 MHz	-53.8	N/A
	1000 MHz - 5000 MHz	-46.1	N/A
High Channel, 404.550 MHz			
	9 kHz - 30 MHz	-52.2	N/A
	30 MHz - 1000 MHz	-53.8	N/A
	1000 MHz - 5000 MHz	-44.8	N/A

SPURIOUS CONDUCTED EMISSIONS

XMR 2020.12.30.0

Low Channel, 402.450 MHz, 9 kHz - 30 MHz						
				Value (dBm)	Limit	Result
				-52.6	N/A	N/A

Low Channel, 402.450 MHz, 30 MHz - 1000 MHz						
				Value (dBm)	Limit	Result
				-53.8	N/A	N/A

SPURIOUS CONDUCTED EMISSIONS

XMI 2020.12.30.0

Low Channel, 402.450 MHz, 1000 MHz - 5000 MHz						
				Value (dBm)	Limit	Result
				-46.1	N/A	N/A

High Channel, 404.550 MHz, 9 kHz - 30 MHz						
				Value (dBm)	Limit	Result
				-52.2	N/A	N/A

SPURIOUS CONDUCTED EMISSIONS

XMR 2020.12.30.0

High Channel, 404.550 MHz, 30 MHz - 1000 MHz						
				Value (dBm)	Limit	Result
				-53.8	N/A	N/A

High Channel, 404.550 MHz, 1000 MHz - 5000 MHz						
				Value (dBm)	Limit	Result
				-44.8	N/A	N/A

RADIATED POWER (EIRP)

TEST DESCRIPTION

The Field Strength of the Fundamental was measured in the far-field at an FCC Listed Semi-anechoic Chamber. Spectrum analyzer and linearly polarized antennas were used to measure the radiated field strength of the fundamental.

Per 95.2567(b)(1), the maximum radiated field strength for a MEDS transmitter is 250nW EIRP.

The EUT was transmitting an unmodulated signal. The fundamental carriers of the EUT were maximized by rotating the EUT, adjusting the measurement antenna height (1-4 meters) and polarization. The amplitude and frequency of the highest emissions were noted. The EUT was operated in three orthogonal axes to find the worst case orientation for each measurement antenna polarity.

The EUT was then replaced with a substitution antenna that varies depending on the frequency range of the emission. A small biconical antenna is utilized due to the increasing size of the dipole to match the $\frac{1}{2}$ wavelength.

A signal generator is then connected to the substitution antenna and its output is adjusted to match the level previously noted for each frequency. The output of the signal generator is recorded, and by factoring in the cable loss to the substitution antenna and its gain (dBi); the radiated power (dBm) for each fundamental carrier is determined.

Emissions radiated by the cabinet and the antenna identified during the pre-scans were measured using a Peak detector. If there are no detectable emissions above the noise floor, the data included may show noise floor measurements for reference only.
