2. System test configuration

2.1. Justification

The system was configured for testing in a typical fashion (as a customer would normally use it).

2.2. HARDWARE IDENTIFICATION

* Equipment Under Test (EUT):

AK TAG READER

Sn: IN21000157

* Configuration:

- Dimensions : 250x300x60mm
- Frequency band : from 902.75 to 927.27MHZ
- Number of channel : 50
- Channel spacing : 500kHz
- E/S : DC IN (9V-12VDC, 1.6A)
RS232
- Reader module : SIRIT infinity 210
- Rated output power : 29dBm (Software controlled)

The output power is limited at 28dBm by software in order to reach the MPE limit (RF exposure) at 20cm.

- Firmware module : .06A

2.3. AUXILIARIES

The FCC IDs for all equipment, more description of all cables used in the tested system are :

* : Equipment under test.

2.4. EQUIPMENT MODIFICATIONS

None.

2.5. EUT EXERCISE SOFTWARE

The EUT exercise program used during radiated and conducted testing was designed to exercise the equipment under test in a manner similar to a typical use. (Continually reading of tag ID, frequency hopping is enabled with the AK EXPLORER.EXE software). If needed, the EUT was transmitting continuous and hopping function is disabled, using the TABTEST.EXE program.

3. Powerline Conducted Emission Test

The product has been tested according to ANSI C63.4-(2003) and FCC Part 15 subpart C.

The product has been tested with 110V/60Hz power line voltage and compared to the FCC Part 15 subpart C §15.207 limits. Measurement bandwidth was 9kHz from 150 kHz to 30 MHz.

Measurement was initially made with an HP-8591EM Spectrum Analyzer in peak mode. This was followed by a Quasi-Peak, i.e. CISPR measurement with the Rohde & Schwarz ESH3 receiver for any strong signal. If the average limit is met when using a Quasi-Peak detector, the EUT shall be deemed to meet both limits and measurement with the average detector is unnecessary.

The Peak data are shown on the following plots. Quasi-Peak and Average measurements are detailed in a table with frequencies and levels measured.

Interconnecting cables and equipment's were moved to position that maximized emission. A summary of the worst case emissions found in all test configurations and modes is shown on the following page.

3.1. SET-UP

The EUT is placed on a table at 0.8m height. The cable of the power adapter has been shorted to 1meter length. The EUT (AC/DC power adapter) is powered through the LISN (measure). The peripheral equipment (PC) is connected to a separate LISN.

- EUT is ON
- The tag ID is being read continually (frequency hopping in enable).

9. Spurious Emissions (Radiated)

9.1. SET-UP

The installation of EUT is identical for pre-characterization measurement in a 3 meters full anechoic chamber and for measures on a 3 meters Open site.

The EUT is placed on a non-conducting table of 80cm height. A Tag is set on the reader.

Equipment configuration and running mode:

- EUT is ON;
- EUT was transmitting continuous and hopping function was disable for spurious emissions measurement.
- EUT was transmitting continuous and hopping function was enable for band edge measurement.

The product has been tested according to ANSI C63.4(2003), FCC part 15 subpart C. Radiated Emission were measured on an open area test site. A description of the facility is on file with the FCC.

The product has been tested at a distance of **3 meters** from the antenna. The RBW and VBW are 1MHz for peak measurement.

For average measurement, the RBW is 1MHz and VBW is 10Hz.

Antenna height search was performed from 1m to 4m for both horizontal and vertical polarization. Continuous linear turntable azimuth search was performed with 360 degrees range.

Equipment was moved to position that maximized emission.

9.2. TEST EQUIPMENT
