10 Frequency Stability

10.1 Requirement:

§27.54 The frequency stability shall be sufficient to ensure that the fundamental emissions stay within the authorized bands of operation.

10.2 Procedure:

The procedure described in FCC Publication 971168 D01 Power Meas License Digital Systems v03r01 was used. Tests are performed in accordance with ANSI C63.26 Section 5.6 and CFR47 FCC Parts 2.1055.

The EUT was placed inside the temperature chamber. The EUT was setup to transmit the maximum power at low and high channel. After the temperature stabilized for approximately 20 minutes, the transmitting frequency was measured by using the occupied bandwidth function on the Spectrum analyzer to make sure the lower and upper frequencies of the occupied bandwidth remains within the assigned band of 2450-2560MHz. The measurements were made on the low and high frequency with a 10 degree increment in temperature.

At the room temperature, the frequency was measured when the EUT was powered with the nominal voltage, 48VDC (minimum), and 57VDC (maximum) voltage as declared by customer.

10.3 Result:

The sample tested was found to Comply.

11 Transmitter spurious emissions

11.1 Requirement:

The power of any emission outside of the authorized operating frequency ranges must be attenuated below the transmitting power (P) by a factor of at least $75 + 10 \log(P)$ dB.

11.2 Procedure:

The procedure described in FCC Publication 971168 D01 Power Meas License Digital Systems v03r01 was used. Tests are performed in accordance with ANSI C63.26 Section 5.7, CFR47 FCC Parts 2.1051 and 2.1053.

Conducted Spurious Emission:

A spectrum analyzer was connected to the antenna port of the transmitter.

1. Set the RBW = 100 kHz.
2. Set the VBW $\geq 3 \times$ RBW.
3. Detector = peak.
4. Sweep time = auto couple.
5. Trace mode = max hold.
6. Allow trace to fully stabilize.
7. Use the peak marker function to determine the maximum amplitude level.

The unwanted emissions were measured from 30 MHz to 10 GHz for low, mid, and high channel for both 5MHz & 10MHz Bandwidth. Plots are corrected for cable loss and then compared to the limits.

Radiated Spurious Emission:

The measurement antenna was placed at a distance of 10 meters for 30MHz – 1GHz and 3 meters for 1-10GHz from the EUT. During the tests, the antenna height and polarization as well as EUT azimuth were varied in order to identify the maximum level of emissions from the EUT.

The frequency range up to 10th harmonic was investigated. The worst case of emissions was reported.

During the spurious emission measurement, the antenna port of the EUT was terminated by 50ohms load. The substitution method was used to investigate at the highest peak in each frequency range (30MHz – 1GHz and 1GHz – 26GHz). The EUT was substituted by a reference antenna (Biconical antenna for 30MHz – 200MHz, log-periodic for 200MHz – 1GHz, or Horn antenna - above 1GHz), connected to a signal generator. The signal generator output level (V_g in dBm) was adjusted to obtain the same reading as from EUT. The ERP at the spurious emissions frequency was calculated as follows.

$$EIRP_{(dBm)} = V_g + G_{(dBd)} + CF_{(dB)}$$

The spurious emissions attenuation is the difference between the ERP level at the fundamental frequency and the level of the spurious emissions.

Preliminary testing was performed for all modulation/data rate modes. The worse-case data rate which resulted in the highest power and lowest spectrum were selected for final measurements:

5 MHz, Modulation: TM1.1-QPSK & 10 MHz, Modulation: TM1.1-QPSK

11.3 Results:

The sample tested was found to Comply.

ERP is calculated as: $ERP_{(dBm)} = Sig\ Gen_{(dBm)} + Antenna\ Gain_{(dBi)} - Cable\ Loss_{(dB)}$

Note: Investigation performed up to 26.0 GHz. All other emissions not reported are at least 10dB below the limits

Result: Complies by 0.9 dB

11.4 Test Setup Configuration:

The following photographs show the testing configurations used.

Test Personnel: Minh Ly
Supervising/Reviewing
Engineer:
(Where Applicable) _____

Test Date: 11/04/2020

Product Standard: FCC Part 27
Input Voltage: 56 VDC (POE)

Limit Applied: See report section 11.1

Pretest Verification w/
Ambient Signals or
BB Source: N/A

Ambient Temperature: 23 °C

Relative Humidity: 44 %

Atmospheric Pressure: 30 inHg

Deviations, Additions, or Exclusions: None

12 List of Test Equipment

Measurement equipment used for emission compliance testing utilized the equipment on the following list:
