Note: The device only supports downlink LTE CA. The maximum tune-up power and antenna gain with downlink carrier aggregation active is the same as LTE Release 8 when downlink carrier aggregation is inactive, so additional MPE Evaluation is not required for downlink LTE CA.

1.1 General Description

B525s-65a LTE/DC-HSPA+/WCDMA/EDGE/GPRS/GSM mutli-mode LTE CPE is subscriber equipment in the LTE/UMTS/GSM system and support WLAN 802.11a/b/g/n/ac. B525s-65a implement such functions as RF signal receiving/transmitting, LTE/DC-HSPA+/WCDMA and EDGE/GPRS/GSM protocol processing, data service etc. It provides USIM card interface, RJ45/RJ11 Ethernet interface, USB port and external antenna interfaces.

7 RF Exposure Requirements

An estimation of MPE in this application for product is used to ensure if it complies to the rules of the standard in the regulation list above.

Maximum permissible exposure (MPE) refers to the RF energy that is acceptable for human exposure. It is broken down into two categories, Occupational/controlled and General population/uncontrolled.

Occupational/controlled limits apply in situations in which persons are exposed as a consequence of their employment provided those persons are fully aware of the potential for exposure and can exercise control over their exposure. Limits for occupational/controlled exposure also apply in situations when an individual is transient through a location where occupational/controlled limits apply provided he or she is made aware of the potential for exposure.

General population/uncontrolled exposures apply in situations in which the general public may be exposed, or in which persons that are exposed as a consequence of their employment may not be fully aware of the potential for exposure or can not exercise control over their exposure.

A rough estimation of the expected exposure in power flux density on a given point can be made with the following equation:

$$S = \frac{P \times G}{4 \times \pi \times R^2}$$

Where:

S = power density

P = power input to the antenna

G = numeric gain of the antenna in the direction of interest relative to an isotropic radiator

R = distance to the centre of radiation of the antenna

EIRP = P * G

The antenna of the product, under normal use condition is at least 20 cm away from the

body of the user. Warning statement to the user for keeping at least 20cm separation distance and the prohibition of operating to a person has been printed on the user's manual. Therefore, the S of the device is calculated with R=20cm, and if it is below the limit S, then we can conclude the device complies with the rules.

7.1 FCC MPE Limits

We analysis if it comply with the limits for General population/uncontrolled exposure. The FCC MPE limits for field strength and power density are given in 47CFR 1.1310(Table below).These limits are generally based on recommended exposure guidelines published by the National Council on Radiation Protection and Measurements (NCRP), and also partly based on guidelines recommended by the American National Standards Institute (ANSI) in Section 4.1 of ANSI/IEEE C95.1.

Table: Limits For Maximum Permissible Exposure (MPE)

(A) Limits for Occupational/controlled Exposure				
Frequency Range(MHz)	Electric Field Strength(E)(V/m)	Magnetic Field Strength(H)(A/m)	Power Density (S)(mW/cm ²)	Averaging Time (minute) E ² , H ² or S

9 Exposure calculations for multiple sources(FCC)

When a number of sources at different frequencies, and/or broadband sources, contribute to the total exposure, it becomes necessary to weigh each contribution relative to the MPE in accordance with the provisions of Table(A) and Table(B). To comply with the MPE, the fraction of the MPE in terms of E^2 , H^2 (or power density) incurred within each frequency interval should be determined and the sum of all such fractions should not exceed unity.

In order to ensure compliance with the MPE for a controlled environment, the sum of the ratios of the power density to the corresponding MPE should not exceed unity. That is

$$\sum_{i=1}^n \frac{S_i}{MPE_i} \leq 1$$

The product also has multiple transmitters The Simultaneous Transmission Possibilities are as below:

NO.	Simultaneous Tx Combination
1	WLAN 2.4G MIMO(2*2)
2	GSM/UMTS/LTE +WLAN 2.4G SISO/ MIMO(2*2)
3	WLAN 5G MIMO(2*2 or 3*3)
4	GSM/UMTS/LTE +WLAN 5G SISO/ MIMO(2*2 or 3*3)
5	WLAN 2.4G SISO/MIMO + WLAN 5G (Ant 3)
6	GSM/UMTS/LTE +WLAN 2.4G SISO (Antenna 1 or 2) + WLAN 5G(Antenna 2 or 1) + WLAN 5G(Antenna 3)
7	GSM/UMTS/LTE + WLAN 2.4G MIMO + WLAN 5G (Ant 3)

Note:

- 1) The device has four GSM/UMTS/LTE antennas: Internal Antenna 1, Internal Antenna 2, External Antenna1 and External Antenna 2. They can not transmit simultaneously.
- 2) The device has three WLAN antennas: WLAN Antenna 1 Antenna 2 and Antenna 3:
 - a) The WLAN Antenna 1 and Antenna 2 can support WLAN 2.4G and WLAN 5G.
 - b) The WLAN Antenna 3 only supports WLAN 5G.
 - c) The WLAN 2.4G can support 2*2 MIMO.
 - d) The WLAN 5G can support 2*2 MIMO or 3*3 MIMO.
 - f) For each WLAN Antenna (Antenna 1 or Antenna 2), it can be used for WLAN 2.4G or WLAN 5G, but WLAN 2.4G and WLAN 5G can not transmit simultaneously.

According to the Table above, we can conclude that the calculation results of all simultaneous transmission possibilities are less than 1, so it is into compliance.

Therefore the product also meets the requirements under multiple sources condition.
