4. EUT Operations and Test Configurations

4.1 Principle of Configuration Selection

Emission :

The equipment under test (EUT) was configured to measure its highest possible radiation level. The test modes were adapted accordingly in reference to the instructions for use. For each testing mode different configurations were used, Refer to the individual tests.

4.2 EUT Operation Mode

No.	Mode	Description
1	Normal Operation	DC 12V voltage is supplied to the EUT. The EUT is a radar device that detects external frequencies in the 10.525 GHz, 24.15 GHz and 33 to 36 GHz bands. The EUT has enabled the Bluetooth and Wi-Fi 2.4GHz functions and has recorded video with an internal camera, checked and tested that video.
* The EUT is a product with the RADAR DETECTOR function, and the RE test in the 11.7-12.2GHz frequency range was conducted.		

4.3 Test Configuration Mode

No.	Mode	Description
1	Normal Operation	EUT connected to the DC supply. EUT AUX port connected to Headset EUT mini USB port is terminated. Connect Micro SD Card to Micro SD Card Slot of EUT

4.4 Supported Equipment

Used*	Product Type	Manufacturer	Model	Remarks
AE	Headset	SAMSUNG	SHS-150V/M	N/A
AE	Micro SD Card	N/A	N/A	N/A
*Abbreviations: AE - Auxiliary/Associated Equipment, or SIM - Simulator				

4.5 EUT In/Output Port

7. Test Results : Emission

7.1 Conducted Disturbance

ANSI C63.4		Mains terminal disturbance voltage			Result
<u>Method:</u> The AMN placed 0,8 m from the boundary of the unit under test and bonded to a ground reference plane. This distance was between the closest points of the AMN and the EUT. All other units of the EUT and associated equipment were at least 0,8 m from the AMN. All power was connected to the system through Artificial Mains Network (AMN). Conducted voltage measurements on mains lines were made at the output of the AMN. The measuring port of the LISN for EUT was connected to spectrum analyzer. Using conducted emission test software, the emissions were scanned with peak detector mode. After scanning over the frequency range, suspected emissions were selected to perform final measurement. When performing final measurement, the receiver was used which has Quasi-Peak detector and CISPR Average detector. For (0.15 ~ 30) MHz frequency range, Quasi-Peak detector with 10 kHz RBW and 30 kHz VBW was used. By varying the configuration of the test sample and the cable routing it was attempted to maximize the emission.					Not Applicable

7.2 Radiated Disturbance

ANSI C63.4	Radiated disturbance 30 MHz –30 GHz**			Result
<u>Method:</u> Preliminary (peak) measurements were performed at an antenna to EUT separation distance of 10 or 3 meter below 1GHz and 3 meter above 1GHz. The EUT was rotated 360° about its azimuth with the receive antenna located at various heights in horizontal and vertical polarities. Final measurements were then performed by rotating the EUT 360° and adjusting the receive antenna height from 1 to 4 m. All frequencies were investigated in both horizontal and vertical antenna polarity, where applicable. For final measurement below 1 GHz frequency range, Quasi-Peak detector with (RBW = 120 kHz Bandwidth) was used. For final measurement above 1 GHz frequency range, Peak detector with (RBW = 1 MHz Bandwidth) and CISPR Average detector with (RBW = 1 MHz Bandwidth) were used.				Comply
