Table 7-2. Conducted Band Edge Measurements

Note:

Per ANSI C63.26-2015 Section 6.4.3.1 and KDB 662911 v02r01 Section E)1), the conducted emissions at Antenna 1 and Antenna 2 were first measured separately during MIMO transmission as shown in the section above. The measured values were then summed in linear power units then converted back to dBm.

Lower band edge was investigated at 869MHz, lower extended band edge at 868MHz, upper band edge at 894MHz, and upper extended band edge at 895MHz.

Sample MIMO Calculation:

At 869.7MHz in QPSK modulation, the average conducted emission was measured to be -20.37 dBm for Antenna-1 and -20.42 dBm for Antenna-2.

$$\text{Antenna 1} + \text{Antenna 2} = \text{MIMO}$$

$$(-20.37 \text{ dBm} + -20.42 \text{ dBm}) = (0.00918 \text{ mW} + 0.00908 \text{ mW}) = 0.0183 \text{ mW} = -17.38 \text{ dBm}$$

7.6 Peak-Average Ratio

RSS-132(5.4)

Test Overview

A peak to average ratio measurement is performed at the conducted port of the EUT. The spectrum analyzers Complementary Cumulative Distribution Function (CCDF) measurement profile is used to determine the largest deviation between the average and the peak power of the EUT in a given bandwidth. The CCDF curve shows how much time the peak waveform spends at or above a given average power level. The percent of time the signal spends at or above the level defines the probability for that particular power level.

Test Procedure Used

KDB 971168 D01 v03 – Section 5.7.1

Test Settings

1. The signal analyzer's CCDF measurement profile is enabled
2. Frequency = carrier center frequency
3. Measurement BW > Emission bandwidth of signal
4. The signal analyzer was set to collect one million samples to generate the CCDF curve
5. The measurement interval was set depending on the type of signal analyzed. For continuous signals (>98% duty cycle), the measurement interval was set to 1ms. For burst transmissions, the spectrum analyzer is set to use an internal "RF Burst" trigger that is synced with an incoming pulse and the measurement interval is set to less than the duration of the "on time" of one burst to ensure that energy is only captured during a time in which the transmitter is operating at maximum power

Test Setup

The EUT and measurement equipment were set up as shown in the diagram below.

Figure 7-4. Test Instrument & Measurement Setup

Test Notes

None.

7.7 Radiated Spurious Emissions Measurements – Above 1GHz

§2.1053, 22.917(a), RSS-132(5.5)

Test Overview

Radiated spurious emissions measurements are performed using the substitution method described in ANSI/TIA-603-E-2016 with the antenna output ports terminated in 50ohms while the EUT is transmitting at maximum power. Measurements on signals operating above 1GHz are performed using vertically and horizontally polarized broadband horn antennas.

Test Procedures Used

KDB 971168 D01 v03 – Section 5.8

ANSI/TIA-603-E-2016 – Section 2.2.12

Test Settings

1. RBW = 1MHz
2. VBW $\geq 3 \times$ RBW
3. Span = 1.5 times the OBW
4. No. of sweep points $\geq 2 \times$ span / RBW
5. Detector = RMS
6. Trace mode = Max Hold
7. The trace was allowed to stabilize

The EUT and measurement equipment were set up as shown in the diagram below.

Figure 7-5. Radiated Test Setup > 1GHz

Test Notes

- 1) The EUT was tested all possible test configurations and positioning. The worst case emissions are reported with the EUT positioning, modulations, and channel bandwidth configurations shown in the tables below.
- 2) This unit was tested while powered by a -48VDC power supply.
- 3) The EUT was tested while transmitting from both antenna ports simultaneously with both ports terminated in 50ohms.
- 4) The spectrum is measured from 9kHz to the 10th harmonic of the fundamental frequency of the transmitter. The worst-case emissions are reported.
- 5) Emissions below 18GHz were measured at a 3 meter test distance while emissions above 18GHz were measured at a 1 meter test distance with the application of a distance correction factor.
- 6) The "-" shown in the following RSE tables are used to denote a noise floor measurement.

7.8 Radiated Spurious Emissions Measurements – Below 1GHz

§2.1053, §22.917(a), RSS-132(5.5)

Test Overview

Measurements on signals operating below 1GHz are performed using horizontally and vertically polarized broadband antennas. All measurements are performed as RMS measurements while the EUT is operating at maximum power, and at the appropriate frequencies.

Test Procedures Used

KDB 971168 D01 v03 – Section 5.8

ANSI/TIA-603-E-2016 – Section 2.2.12

Test Settings

Quasi-Peak Field Strength Measurements

1. Analyzer center frequency was set to the frequency of the radiated spurious emission of interest
2. RBW = 120kHz (for emissions from 30MHz – 1GHz)
3. Detector = RMS
4. Sweep time = auto couple
5. Trace mode = max hold
6. Trace was allowed to stabilize

FCC ID: QLJ4GRFN-005	 MEASUREMENT REPORT (CERTIFICATION) 		Approved by: Quality Manager
Test Report S/N: 1M1801290011-02.QLJ	Test Dates: 2/5-2/22/2018	EUT Type: Remote Radio Head	Page 168 of 175

The EUT and measurement equipment were set up as shown in the diagram below.

Figure 7-6. Radiated Test Setup < 1GHz

Test Notes

- 1) The EUT was tested all possible test configurations and positioning. The worst case emissions are reported with the EUT positioning, modulations, and channel bandwidth configurations shown in the tables below.
- 2) This unit was tested while powered by a -48VDC power supply.
- 3) Emissions were measured at a 3m test distance.
- 4) The spectrum is measured from 30MHz to 1GHz. The worst-case emissions are reported.
- 5) The pre-scan plots below are performed using Max Hold traces but final measurements were made using Trace Averaging.

7.9 Frequency Stability / Temperature Variation

\$2.1055, \$22.355, RSS-132(5.3)

Test Overview and Limit

Frequency stability testing is performed in accordance with the guidelines of ANSI C63.26-2015. The frequency stability of the transmitter is measured by:

- a.) **Temperature:** The temperature is varied from -30°C to +50°C in 10°C increments using an environmental chamber.
- b.) **Primary Supply Voltage:** The primary supply voltage is varied from 85% to 115% of the supply voltage. For hand-carried, battery-powered equipment, primary supply voltage is reduced to the battery operating end point which shall be specified by the manufacturer.

For Part 22, RSS-132, the frequency stability of the transmitter shall be maintained within $\pm 0.00015\%$ (± 1.5 ppm) of the center frequency.

Test Procedure Used

ANSI C63.26-2015 Section 5.6

Test Settings

1. The carrier frequency of the transmitter is measured at room temperature (20°C to provide a reference).
2. The equipment is turned on in a "standby" condition for fifteen minutes before applying power to the transmitter. Measurement of the carrier frequency of the transmitter is made within one minute after applying power to the transmitter.
3. Frequency measurements are made at 10°C intervals ranging from -30°C to +50°C. A period of at least one half-hour is provided to allow stabilization of the equipment at each temperature level.

Test Setup

The EUT was connected via an RF cable to a spectrum analyzer with the EUT placed inside an environmental chamber.

Test Notes

None
