

Modifications to WLAN6060SD

FCC ID.: QPUWLAN6060SD

The WLAN 6060SD is modified as below:

- 1) M201 added. This shield was added over the VCO to reduce radiated emission levels from the VCO.
- 2) Q201 added. This transistor is added to have additional buffering on signal line PE1 coming from the baseband chip.
- 3) U103 Intersil ISL 3871. This chip is the same except that the die is "re-bumped".

All of these components are highlighted in yellow on the revised BOM.

The model of the device is changed to 6065SD to reflect these changes.
