1. EUT and Accessory Information

1.1 EUT description

The EUT is a triple band (900/1800/1900MHz) GSM mobile phone. The highest internal frequency of the EUT is 3979.6 MHz.

1.2 EUT and accessories

	<i>unit</i>	<i>type</i>	<i>S/N</i>
<i>EUT1</i>	Mobile phone	RH-6	004400/25/170120/5
<i>EUT2</i>	Mobile phone	RH-6	004400/25/170130/4
<i>Accessories</i>	Battery	BL-4C	0670386111243333232
	Dummy Battery		
	Antenna adapter	Special fixed, EUT2	

2. Standards and measurement methods

The test were performed in guidance of the CFR 47 part 24, part 2, EIA/TIA-603-A (2001) and RSS-133

3. Test results

3.1 Radiated RF output power

The test was performed as a compliance test. The test parameters concerned were as follows:

<i>EUT</i>	EUT1
<i>Site name</i>	Nemko Oy / Perkkää
<i>Section in CRF 47</i>	§ 24.232, (b)
<i>Section in RSS-133</i>	6.2
<i>Date of testing</i>	29.09.2003
<i>Test equipment</i>	42, 89, 201, 525, 350, 184, 401
<i>Test conditions</i>	21 °C, 35 % RH
<i>Test result</i>	PASS

3.1.1 Test method and limit

The test was performed inside a semi anechoic shielded room. For the duration of the test the EUT was placed on a non-conductive support 0.8 m high standing on the turntable. In the corner of the chamber there was a communication antenna, which was connected to the BS simulator located outside the room. The radiated power from the EUT was measured with an antenna fixed to a antenna tower. The tower and turn table were remotely controlled to turn the EUT and change the antenna polarization. The measured signal was routed from the measuring antenna to the spectrum analyzer. The BS simulator was used to set the TX channel and power level and modulate the TX signal with different bit patterns. (see photograph 1)

- a) The maximum power level was searched at each frequency by rotating the turntable and adjusting the measuring antenna polarization and height (from 1- 4 m). This level (P_{EUT}) was recorded. The measurements were performed the EUT at all three orthogonal planes
- b) The EUT was replaced with a substituting antenna.
- c) The substituting antenna was fed with the power (P_{Gen}) giving a convenient reading on the spectrum analyzer and the measuring antenna height was adjusted to obtain a maximum reading at spectrum analyzer. That reading (P_{Subst}) on spectrum analyzer was recorded.

The formula below was used to calculate the EIRP of the EUT.

$$P_{EIRP[dbm]} = P_{Measured[db]} - P_{Subst[db]} - L_{Cable[db]} + G_{Antenna[dBi]} + P_{Gen[dbm]}$$

Where

$P_{Measured[dbm]}$ measured power level from the EUT

$P_{Subst[dbm]}$ measured emission level from substitutive antenna

$L_{Cable[db]}$ loss of the cable between substitutive antenna and signal generator

$G_{Antenna[dBi]}$ gain of the substitutive antenna

$P_{Gen[dbm]}$ signal generator power fed to the substitutive antenna

3.4.3 Test results

The formula below was used to calculate the EIRP of the spurious emissions. If there were no emissions closer than 20 dB below the limit line, then the emission levels were measured at the transmitter's harmonics.

$$P_{Emission[dBm]} = P_{Measured[dB]} - P_{Subst[dB]} - L_{Cable[dB]} + G_{Antenna[dBi]} + P_{Gen[dBm]}$$

Where

$P_{Measured[dBm]}$ measured emission level

$P_{Subst[dBm]}$ measured emission level from substitutive antenna

$L_{Cable[dB]}$ loss of the cable between substitutive antenna and signal generator

$G_{Antenna[dBi]}$ gain of the substitutive antenna

$P_{Gen[dBm]}$ signal generator power fed to the substitutive antenna

Calculation example:

$$\begin{aligned} P_{3700.4[dBm]} &= -21.7_{Measured[dB]} - (1.5)_{Subst[dB]} - 4.5_{Cable[dB]} + 9.4_{Antenna[dBi]} + (-10)_{Gen[dBm]} \\ &= -28.3_{dBm} \end{aligned}$$

3.5.1 Test method and limit

The test was performed EUT placed inside a temperature chamber. The BS simulator was used to set the TX channel and power level and modulate the TX signal with different bit patterns.

- The climate chamber temperature was set to the minimum value and the temperature was allowed to stabilize.
- The EUT was placed in the chamber
- The EUT was set in idle mode for 45 minutes.
- The EUT was set to transmit.
- The transmit frequency error was measured immediately
- The steps c - e were repeated for each temperature
