Subject: Class II Permissive Change – Spot Silencer

To Whom It May Concern:

Frederick Energy Products is submitting this application for Class II Permissive Change (C2PC) to the existing FCC certification for the Spot Silencer.

This application is being submitted to address an increase in the fundamental emission field strength observed during market surveillance testing. The increase is not the result of an intentional increase in the output level. Market surveillance testing identified a larger manufacturing variability in the fundamental emission level than was originally anticipated.

The permissive change is filed due to the increased power of the fundamental transmitter radiated field strength. The increased power was discovered during market surveillance, and it was confirmed that the manufacturing variability is greater than originally anticipated by the grantee. It was confirmed that there was no design change to the device's hardware, firmware, or software. Overall, there is no design or component change involved with this modification and the relevant information regarding the device is provided below:

FCC ID: QUI-SPOT-Z

Product Name: Spot Silencer

Model: SPOT-Z / DDAC-SPOT-Z

The completed application form and applicable exhibits, including supporting test documentation, are enclosed with this submission.

Sincerely,

Ishmael Chigumira
