

TEST REPORT

Test Report No. : UL-RPT-RP13194254-1916A V2.0

Manufacturer : Cambium Networks Ltd
Model No. : 60 GHz cnWave V3000
FCC ID : QWP-60V3000
Test Standard(s) : FCC Parts 15.207, 15.209, 15.215 & 15.255

1. This test report shall not be reproduced except in full, without the written approval of UL VS LTD.
2. The results in this report apply only to the sample(s) tested.
3. The sample tested is in compliance with the above standard(s).
4. The test results in this report are traceable to the national or international standards.
5. Version 2.0 supersedes all previous versions.

Date of Issue: 10 November 2020

Checked by:

Sarah Williams
RF Operations Leader, Radio Laboratory

Company Signatory:

Ian Watch
Senior Test Engineer, Radio Laboratory
UL VS LTD

This laboratory is accredited by UKAS.
The tests reported herein have been
performed in accordance with its terms
of accreditation.

1. Customer Information

Company Name:	Cambium Networks Ltd
Address:	Unit B2 Linhay Business Park Eastern Road Ashburton Devon TQ13 7UP United Kingdom

2. Summary of Testing

2.1. General Information

Specification Reference:	47CFR15.255
Specification Title:	Code of Federal Regulations Volume 47 (Telecommunications): Part 15 Subpart C (Radio Frequency Devices) – Section 15.255
Specification Reference:	47CFR15.207, 47CFR15.209 and 47CFR15.215
Specification Title:	Code of Federal Regulations Volume 47 (Telecommunications): Part 15 Subpart C (Intentional Radiators) - Sections 15.207, 15.209 & 15.215
Site Registration:	621311
Location of Testing:	Unit 3 Horizon, Wade Road, Kingsland Business Park, Basingstoke, Hampshire, RG24 8AH, United Kingdom
Test Dates:	03 July 2020 to 28 September 2020

2.2. Summary of Test Results

FCC Reference (47CFR)	Measurement	Result
Part 15.207	Transmitter AC Conducted Emissions	
Part 15.255(c)(1)(ii)	Transmitter EIRP	
Part 15.255(e)	Transmitter Peak Output Power	
Part 15.255(e)(1)	Transmitter 6 dB Bandwidth	
Part 15.215(c)	Transmitter 20 dB Bandwidth	
Part 15.255(d) / 15.209	Transmitter Spurious Emissions	
Part 15.255(f)	Transmitter Frequency Stability (Temperature & Voltage Variation)	
Key to Results  = Complied  = Did not comply		

2.3. Methods and Procedures

Reference:	ANSI C63.10-2013
Title:	American National Standard of Procedures for Compliance Testing of Unlicensed Wireless Devices
Reference:	KDB 174176 D01 Line Conducted FAQ v01r01 June 3, 2015
Title:	AC Power-Line Conducted Emissions Frequently Asked Questions

2.4. Deviations from the Test Specification

For the measurements contained within this test report, there were no deviations from, additions to, or exclusions from the test specification identified above.

3. Equipment Under Test (EUT)

3.1. Identification of Equipment Under Test (EUT)

Brand Name:	Cambium Networks
Model Name or Number:	60 GHz cnWave V3000
Test Sample Serial Number:	V5WA003W4KFC
Hardware Version:	P7
Software Version:	DM Tools 3.2.0.1
Firmware Version:	10.11.1.10448236
FCC ID:	QWP-60V3000

3.2. Description of EUT

The equipment under test was a point-to-point / point-to-multipoint high gain client node operating in the 57-71 GHz band.

3.3. Modifications Incorporated in the EUT

No modifications were applied to the EUT during testing.

3.4. Additional Information Related to Testing

Category of Equipment:	Transceiver	
Channel Spacing:	2.16 GHz	
Modulation Type:	BPSK, QPSK & 16QAM	
Antenna Type:	Integrated Patch & Parabolic Reflector	
Antenna Gain:	22.5 dBi (patch) 22 dB (reflector) Combined: 44.5 dBi	
Transmit Frequency Range:	57 GHz to 66 GHz	
Transmit Channels Tested:	Channel ID	Channel Frequency (GHz)
	Bottom	58.320
	Middle	62.640
	Top	64.800
Power Supply Requirement:	Nominal	56 VDC via 120 VAC PoE
	Minimum	85 VAC (PoE)
	Maximum	276 VAC (PoE)
Tested Temperature Range:	Minimum	-20°C
	Maximum	50°C

3.5. EUT Settings

Channel	Sector	Tx Lineup	RF Lineup	DAC	LO GC	E-Base	Notch
1	27	0	11	32/32	1	0	-
3	27	0	13	42/42	1	0	-
4	27	0	12	42/42	0	0	-

3.6. Support Equipment

The following support equipment was used to exercise the EUT during testing:

Description:	PoE
Brand Name:	Cambium Networks
Model Name or Number:	N000000L142A
Serial Number:	2020000773

Description:	Test Laptop
Brand Name:	HP EliteBook
Model Name or Number:	NH121UC#ABU
Serial Number:	2CE00223BK

Description:	Ethernet Cables. Quantity 3. Length 1 m / 3 m / 10 m
Brand Name:	RS Pro
Model Name or Number:	Not marked or stated
Serial Number:	Not marked or stated

4. Operation and Monitoring of the EUT during Testing

4.1. Operating Modes

The EUT was tested in the following operating mode(s):

- Transmitting with BPSK MCS5 modulation, which was found to be the worst case mode after preliminary investigation.
- Operating on bottom, middle and top channels with a 2.16 GHz channel bandwidth.
- Transmitting at maximum output power with beamforming locked to sector 27 (straight ahead), which was found to be the direction of highest EIRP during preliminary investigation.

4.2. Configuration and Peripherals

The EUT was tested in the following configuration(s):

- A laptop PC with Qualcomm DMTools and QRCT software was used to configure the EUT during the testing. Telnet commands were used to set the channel and modulation. The laptop was connected to the EUT via Ethernet.
- The EUT was powered by a PoE supply connected to 120 VAC mains.
- Testing at voltage extremes was performed with the PoE supply connected to a variable AC power supply.
- Due to the large dimensions of the 22 dB reflector, the far field measurement distance is in excess of 100 m. For in-band tests, the reflector was removed to expose the smaller 22.5 dBi patch, allowing measurements to be made in the far field at 3 m. The 22 dB reflector gain was added to the measured results. An enquiry was made to the FCC OET and this method was deemed acceptable.
- Transmitter radiated spurious emissions tests were performed with the 22 dB reflector fitted. All measurements were performed in the far field of the measurement antenna.

5. Measurements, Examinations and Derived Results

5.1. General Comments

Measurement uncertainties are evaluated in accordance with current best practice. Our reported expanded uncertainties are based on standard uncertainties, which are multiplied by an appropriate coverage factor to provide a statistical confidence level of approximately 95%. Please refer to *Section 6: Measurement Uncertainties* for details.

In accordance with UKAS requirements all the measurement equipment is on a calibration schedule. All equipment was within the calibration period on the date of testing.

5.2. Test Results

5.2.1. Transmitter AC Conducted Spurious Emissions

Test Summary:

Test Engineer:	Patrick Jones	Test Date:	03 September 2020
Test Sample Serial Number:	V5WA003W4KFC		

FCC Reference:	Part 15.207
Test Method Used:	ANSI C63.10 Section 6.2 / FCC KDB 174176 and notes below

Environmental Conditions:

Temperature (°C):	22
Relative Humidity (%):	48

Note(s):

1. The EUT was connected to a PoE adapter via ethernet cable. The PoE adapter was connected to 120 VAC 60 Hz single phase supply via a LISN.
2. In accordance with FCC KDB 174176 Q4, tests were performed with a 240 VAC 60 Hz single phase supply as this was within the voltage range marked on the PoE supply.
3. Pre-scans were performed and markers placed on the highest live and neutral measured levels. Final measurements were performed on the marker frequencies and the results entered into the tables below.
4. A pulse limiter was fitted between the LISN and the test receiver.

Test setup:

Transmitter AC Conducted Spurious Emissions (continued)**Results: Live / Quasi Peak / 120 VAC 60 Hz**

Frequency (MHz)	Line	Level (dB μ V)	Limit (dB μ V)	Margin (dB)	Result
0.155	Live	45.6	65.7	20.1	Complied
0.470	Live	41.1	56.5	15.4	Complied

5.2.2. Transmitter EIRP**Test Summary:**

Test Engineer:	Ben Mercer	Test Date:	21 August 2020
Test Sample Serial Number:	V5WA003W4KFC		

FCC Reference:	Part 15.255(c)(1)(ii)
Test Method Used:	ANSI C63.10 Section 9.11

Environmental Conditions:

Temperature (°C):	23
Relative Humidity (%):	64

Note(s):

1. The measurement antenna was connected to an RF detector via a 4 way waveguide switch. A CW signal generator and wideband thermocouple power sensor were connected to the remaining two ports.
2. The RF detector was connected to the 50 Ω input of a digital storage oscilloscope via a 10 MHz low pass filter.
3. The EUT peak and average voltages were measured on the oscilloscope. The waveguide switch was then rotated to connect the signal generator to the RF detector, and the signal generator output was adjusted to match the previously measured voltages. The waveguide switch was then rotated to connect the signal generator output to the thermocouple power sensor, and the signal generator output power was measured.
4. The substituted levels recorded below include the calibrated path loss of the waveguide switch.
5. In accordance with Part 15.255(c)(1)(ii), the peak and average EIRP limits shall be reduced by 2 dB for every dB that the antenna gain is less than 51 dBi. The combined gain of the patch antenna and reflector is 44.5 dBi. The limit reduction was calculated as follows:

$$2 \times (51 \text{ dBi} - 44.5 \text{ dBi}) = 13 \text{ dB}$$

$$\begin{aligned}\text{Peak EIRP Limit: } & 85 \text{ dBm} - 13 \text{ dB} = 72 \text{ dBm} \\ \text{Average EIRP Limit: } & 82 \text{ dBm} - 13 \text{ dB} = 69 \text{ dBm}\end{aligned}$$

Transmitter EIRP (continued)

Test setup:

Transmitter EIRP (continued)**Results: Bottom Channel / Peak**

Frequency (GHz)	Level (V)	Substituted EIRP Level (dBm)	Reflector Gain (dB)	Corrected EIRP Level (dBm)	Limit (dBm)	Margin (dB)	Result

5.2.3. Transmitter Peak Conducted Output Power**Test Summary:**

Test Engineer:	Ben Mercer	Test Date:	21 August 2020
Test Sample Serial Number:	V5WA003W4KFC		

FCC Reference:	Part 15.255(e)
Test Method Used:	ANSI C63.10 Section 9.11

Environmental Conditions:

Temperature (°C):	23
Relative Humidity (%):	64

Note(s):

1. The measurement antenna was connected to an RF detector via a 4 way waveguide switch. A CW signal generator and wideband thermocouple power sensor were connected to the remaining two ports.
2. The RF detector was connected to the 50 Ω input of a digital storage oscilloscope via a 10 MHz low pass filter.
3. The EUT peak and average voltages were measured on the oscilloscope. The waveguide switch was then rotated to connect the signal generator to the RF detector, and the signal generator output was adjusted to match the previously measured voltages. The waveguide switch was then rotated to connect the signal generator output to the thermocouple power sensor, and the signal generator output power was measured.
4. The stated antenna gain was subtracted from the measured EIRP to obtain the conducted power.
5. The substituted levels recorded below include the calibrated path loss of the waveguide switch.

Test setup:

Transmitter Peak Conducted Output Power (continued)**Results: Bottom Channel**

EIRP Level (dBm)	Antenna Gain (dBi)	Conducted Level (dBm)	Conducted Level (mW)	Limit (mW)	Margin (mW)	Result
60.2	44.5	15.7	37.2	500	462.8	Complied

Results: Middle Channel

EIRP Level (dBm)	Antenna Gain (dBi)	Conducted Level (dBm)	Conducted Level (mW)	Limit (mW)	Margin (mW)	Result

5.2.4. Transmitter 6 dB Bandwidth**Test Summary:**

Test Engineer:	Ben Mercer	Test Date:	24 August 2020
Test Sample Serial Number:	V5WA003W4KFC		

FCC Reference:	Part 15.255(e)(1)
Test Method Used:	ANSI C63.10 Section 9.3

Environmental Conditions:

Temperature (°C):	23
Relative Humidity (%):	50

Note(s):

1. The analyser span was set to between two and three times the emission bandwidth. The RBW was set to 100 kHz, and the VBW was set to three times the RBW. The marker delta function was used to measure 6 dB down from the peak on both sides of the emission. The resulting frequency delta between the two markers was recorded as the emission bandwidth.

Test setup:

Transmitter 6 dB Bandwidth (continued)**Results:**

Channel	RBW (kHz)	VBW (kHz)	Emission Bandwidth (MHz)
Bottom	100	300	1480.000
Middle	100	300	1640.000
Top	100	300	1605.000

**Bottom Channel****Middle Channel****Top Channel**

5.2.5. Transmitter 20 dB Bandwidth**Test Summary:**

Test Engineer:	Ben Mercer	Test Date:	24 August 2020
Test Sample Serial Number:	V5WA003W4KFC		

FCC Reference:	Part 15.215(c)
Test Method Used:	ANSI C63.10 Section 6.9.2

Environmental Conditions:

Temperature (°C):	23
Relative Humidity (%):	50

Note(s):

1. The signal analyser resolution bandwidth was set to 3 MHz and the video bandwidth to 50 MHz. A peak detector was used, sweep time was set to auto and the trace mode was Max Hold. The span was set to 5 GHz. The marker delta function was used to measure 20 dB down from the peak on both sides of the emission. The resulting frequency delta between the two markers was recorded as the 20 dB bandwidth.
2. Due to limitations of the downconverter setup it was not possible to increase the signal analyser span above 5 GHz.

Test setup:

Transmitter 20 dB Bandwidth (continued)**Results:**

Channel	20 dB Bandwidth (MHz)
Bottom	2255.000
Middle	2250.000
Top	2930.000

**Bottom Channel****Middle Channel****Top Channel**

Transmitter 20 dB Bandwidth (continued)**Test Equipment Used:**

Asset No.	Instrument	Manufacturer	Type No.	Serial No.	Date Calibration Due	Cal. Interval (Months)

5.2.6. Transmitter Radiated Spurious Emissions**Test Summary:**

Test Engineers:	Patrick Jones & Nick Tye	Test Dates:	03 July 2020 & 28 September 2020
Test Sample Serial Number:	V5WA003W4KFC		

FCC Reference:	Part 15.255(d) / 15.209
Test Method Used:	ANSI C63.10 Sections 6.3, 6.4, 6.5 & 9.13
Frequency Range:	9 kHz to 1000 MHz

Environmental Conditions:

Temperature (°C):	21 to 23
Relative Humidity (%):	40 to 50

Note(s):

1. The final measured value, for the given emission, in the table below incorporates the calibrated antenna factor and cable loss.
2. The preliminary scans showed similar emission levels below 1 GHz, for each channel of operation. Therefore final radiated emissions measurements below 1 GHz were performed with the EUT set to the middle channel only.
3. All other emissions were at least 20 dB below the appropriate limit or below the noise floor of the measurement system.
4. There are ambient emissions seen between 2 to 30 MHz on the pre-scan plot for 150 kHz to 30 MHz. A background scan is stored on the company server and is available for inspection upon request.
5. Measurements below 30 MHz were performed in a semi-anechoic chamber (asset number K0001) as a distance of 3 metres. The EUT was placed at a height of 80 cm above the reference ground plane in the centre of the chamber turntable. The limit was extrapolated to 3 metres in accordance with ANSI C63.10 Section 6.4.4.2. Correlation data between the semi-anechoic chamber and an open-field test site is available upon request.
6. Measurements between 30 MHz and 1 GHz were performed in a semi-anechoic chamber (Asset Number K0017) at a distance of 3 metres. The EUT was placed at a height of 80 cm above the reference ground plane in the centre of the chamber turntable. Maximum emission levels were determined by height searching the measurement antenna over the range 1 metre to 4 metres.
7. Final measurements were performed and the results entered into the table below. The test receiver resolution bandwidth was set to 120 kHz, using a CISPR quasi-peak detector and a span wide enough to include the entire emission.

Transmitter Radiated Spurious Emissions (continued)**Test setup:**

Transmitter Radiated Spurious Emissions (continued)**Results: Quasi Peak**

Frequency (MHz)	Antenna Polarity	Level (dB μ V/m)	Limit (dB μ V/m)	Margin (dB)	Result

Transmitter Radiated Spurious Emissions (continued)**Test Summary:**

Test Engineers:	Patrick Jones & Ben Mercer	Test Dates:	22 August 2020 to 04 September 2020
Test Sample Serial Numbers:	V5WA003W4KFC		

FCC Reference:	Part 15.255(d) / 15.209
Test Method Used:	ANSI C63.10 Sections 6.3, 6.6, 9.8, 9.9, 9.12 & 9.13
Frequency Range:	1 GHz to 200 GHz

Environmental Conditions:

Temperature (°C):	20 to 24
Relative Humidity (%):	51 to 60

Note(s):

1. The final measured value, for the given emission in the field strength result tables, incorporates the calibrated antenna factor and cable loss.
2. Final measurements above 1 GHz were performed in a semi-anechoic chamber (Asset Number K0001) at a distance of 3 metres. The EUT was placed at a height of 1.5 m above the reference ground plane in the centre of the chamber turntable. Maximum emission levels were determined by height searching the measurement antenna over the range 1 metre to 4 metres.
3. The emission identified by a marker on the 57 - 71 GHz plot is the fundamental.
4. Part 15.255(d)(3) defines a power density limit of 90 pW/cm² at 3 metres for spurious emissions between 40 GHz and 200 GHz. This was converted to a field strength limit of 85.31 dBuV/m using the equations provided in section 9.6 of ANSI C63.10.
5. Measurements distances above 40 GHz were determined using the procedure defined in section 9.8 of ANSI C63.10. Measurements were made at the following distances:
 - 40 GHz to 50 GHz – 1 metre
 - 50 GHz to 75 GHz – 3 metres
 - 75 GHz to 110 GHz – 1 metre
 - 110 GHz to 170 GHz – 2 metres
 - 170 GHz to 200 GHz – 1 metre
6. Where measurements were performed at a distance other than that specified by the limit, a correction factor was calculated using the equation provided in section 9.4 of ANSI C63.10. This correction factor was included in the transducer factor entered on the signal analyser.
7. All other emissions were at least 20 dB below the appropriate limit or below the noise floor of the measurement system.

5.2.7. Transmitter Frequency Stability (Temperature Variation)**Test Summary:**

Test Engineer:	Ben Mercer	Test Date:	15 September 2020
Test Sample Serial Number:	V5WA003W4KFC		

FCC Reference:	Part 15.255(f)
Test Method Used:	ANSI C63.10 Section 9.14

Environmental Conditions:

Ambient Temperature (°C):	24
Ambient Relative Humidity (%):	43

Note(s):

1. The 20 dB emission bandwidth was recorded on a signal analyser at bottom and top channel, and compared to the lower and upper emission edges respectively.
2. Temperature was monitored throughout the test with a calibrated digital thermometer.

Test setup:

Transmitter Frequency Stability (Temperature Variation) (continued)**Results: Bottom Channel / Lower Band Edge**

Temperature (°C)	Lower Band Edge Frequency (MHz)	Lower Emission Bandwidth Frequency (MHz)	Margin (MHz)	Result
-20	57000.000	57235.680	235.680	Complied

5.2.8. Transmitter Frequency Stability (Voltage Variation)**Test Summary:**

Test Engineer:	Ben Mercer	Test Date:	18 September 2020
Test Sample Serial Number:	V5WA003W4KFC		

FCC Reference:	Part 15.255(f)
Test Method Used:	ANSI C63.10 Section 9.14

Environmental Conditions:

Ambient Temperature (°C):	21
Ambient Relative Humidity (%):	41

Note(s):

1. The 20 dB emission bandwidth was recorded on a signal analyser at bottom and top channel, and compared to the lower and upper emission edges respectively.
2. The PoE input voltage was set to 85% and 115% of the stated input voltage range of 100-240 V.
3. Voltage was monitored throughout the test with a calibrated digital voltmeter.

Test setup:

Transmitter Frequency Stability (Voltage Variation) (continued)**Results: Bottom Channel / Lower Band Edge**

Supply Voltage (VAC)	Lower Band Edge Frequency (MHz)	Lower Emission Bandwidth Frequency (MHz)	Margin (MHz)	Result
85.0	57000.000	57188.160	188.160	Complied

6. Measurement Uncertainty

No measurement or test can ever be perfect and the imperfections give rise to error of measurement in the results. Consequently the result of a measurement is only an approximation to the value of the measurand (the specific quantity subject to measurement) and is only complete when accompanied by a statement of the uncertainty of the approximation.

The expression of uncertainty of a measurement result allows realistic comparison of results with reference values and limits given in specifications and standards.

The uncertainty of the result may need to be taken into account when interpreting the measurement results.

The reported expanded uncertainties below are based on a standard uncertainty multiplied by an appropriate coverage factor such that a confidence level of approximately 95% is maintained. For the purposes of this document “approximately” is interpreted as meaning “effectively” or “for most practical purposes”.

Measurement Type	Range	Confidence Level (%)	Calculated Uncertainty
Transmitter EIRP	57 to 71 GHz	95%	± 5.36 dB
Transmitter Peak Output Power	57 to 71 GHz	95%	± 5.36 dB
Transmitter 6 dB Bandwidth	57 to 71 GHz	95%	±4.59 %
Transmitter 20 dB Bandwidth	57 to 71 GHz	95%	±4.59 %
Transmitter Radiated Emissions	9 kHz to 30 MHz	95%	±5.32 dB
Transmitter Radiated Emissions	30 MHz to 1 GHz	95%	±3.30 dB
Transmitter Radiated Emissions	1 GHz to 40 GHz	95%	±2.94 dB
Transmitter Radiated Emissions	40 GHz to 200 GHz	95%	±5.10 dB
Transmitter Frequency Stability	57 to 71 GHz	95%	±4.59 %

The methods used to calculate the above uncertainties are in line with those recommended within the various measurement specifications. Where measurement specifications do not include guidelines for the evaluation of measurement uncertainty the published guidance of the appropriate accreditation body is followed.

7. Report Revision History

Version Number	Revision Details		
	Page No(s)	Clause	Details
1.0	-	-	Initial Version
