7. Measurement Data

7.1. Antenna Requirement (15.203)

Requirement: An intentional radiator shall be designed to ensure that no antenna other than that furnished by the responsible party shall be used with the device. The use of a permanently attached antenna or of an antenna that uses a unique coupling to the intentional radiator shall be considered sufficient to comply with the provisions of this Section.

Status: The device under test utilizes an internal, coil antenna. There is no user access to this antenna.

7.2. Radiated Field Strength of Fundamental (15.209, Section (a))

Requirement: Except as provided elsewhere in this subpart, the emissions from an intentional radiator shall not exceed the field strength levels specified in the following table:

For 144.5 kHz: Field Strength ($\mu\text{V/m}$) = $2400/F(\text{kHz})$ at 300 meters.
 Field Strength ($\mu\text{V/m}$) = $2400/144.5$
 Field Strength ($\mu\text{V/m}$) = 16.61
 Field Strength ($\text{dB}\mu\text{V/m}$) = $20 \text{ LOG}_{10}(16.61)$
 Field Strength ($\text{dB}\mu\text{V/m}$) = 24.41 at 300 meters.

Test Notes: From 110 kHz to 490 kHz, the field strength limit employs an average detector (FCC Part 15.209(d)).

Reference ANSI C63.10-2013 sections 5.3.2 and 6.4.4.2. The following formula was used to extrapolate the measurement distance to the limit distance:

$$FS_{\text{limit}} = FS_{\text{max}} - 40 \log \left(\frac{d_{\text{near field}}}{d_{\text{measure}}} \right) - 20 \log \left(\frac{d_{\text{limit}}}{d_{\text{near field}}} \right) \quad \text{Equation 1}$$

FS_{limit} is the calculation of field strength at the limit distance ($\text{dB}\mu\text{V/m}$) **8.61**

FS_{max} is the measured field strength, expressed in ($\text{dB}\mu\text{V/m}$) (peak) 88.61

$d_{\text{near field}}$ is the $\lambda/2\pi$ distance (Meters) 330.43

d_{measure} is the distance of the measurement point from the EUT (Meters) 3.00

d_{limit} is the reference limit distance (Meters) 300.00

Since $d_{\text{near field}}$ is greater than d_{limit} , the measurement formula was simplified to:

$$FS_{\text{limit}} = FS_{\text{max}} - 40 \log (d_{\text{limit}}/d_{\text{measure}}).$$

Results: Compliant
