1 GENERAL

1.1 Purpose

The purpose of this report is to demonstrate compliance with Part 15 Subpart C of the FCC's Code of Federal Regulations and ISED Canada's Radio Standards Specification RSS-247 Certification for limited modular approval (LMA). Limited modular approval applies due to the absence of onboard voltage regulation and battery only operation.

1.2 Product description

The limited module NXCM Printed Circuit Board Assembly (PCBA) contains a frequency hopping spread spectrum (FHSS) radio operating in the 902-928MHz ISM frequency band. It also contains a cellular radio (FCC ID: XMR2020BG95M2) that is documented in another report. The NXCM provides metrology and communications for natural gas meters.

Technical Information:

Mode of Operation	Frequency Range (MHz)	Number of Channels	Data Rates Supported (kbps)
EA Moe	902.4 – 927.6	25	35.5, 142.2

Modulation Format: 2FSK

Antenna Type / Gain: Embedded Ceramic / 0.75dBi

Operating Voltage: 3.6VDC

Manufacturer Information:

Elster Solutions, LLC

208 S. Rogers Lane

Raleigh, NC 27610

EUT Serial Numbers:

Conducted Sample: 310

Radiated Sample: 378

Test Sample Condition: The test samples were provided in good working order with no visible defects.

1.3 Test Methodology and Considerations

The NXCM LMA can be integrated into an enclosure that supports direct mounting to a gas meter. Due to LMA classification, the module was integrated into the host enclosure for full evaluation.

All modes of operation, including all available data rates were evaluated for each mode. The data presented in this report represents the worst case where applicable.

A DC power supply set to 3.6VDC (nominal battery voltage) was used to support testing due to the batteries being unable to support continuous transmit. Spot checks utilizing the internal battery were performed to ensure the voltage supplied by the power supply was representative of the battery and no differences were found.

Based on radiated measurements of all data rates, the worst-case data rate was 35.5kbps due to no possibility of duty cycle correction of the average value.

The module is designed to only operate with battery power devices. Therefore, AC Mains Conducted Emissions was not performed.

The 900 MHz FHSS addressed in this report cannot transmit simultaneously with the collocated LTE radio FCC ID: XMR2020BG95M2, therefore a simultaneous transmission evaluation was not performed.

Software power settings during test: 200

1.4 Modifications

No modifications were required.

2 TEST FACILITIES

2.1 Location

The radiated and conducted emissions test sites are located at the following address:

TÜV SÜD America Inc.
2320 Presidential Drive, Suite 101
Durham, NC 27703
Phone: 919-748-4615

2.2 Laboratory Accreditations/Recognitions/Certifications

TÜV SÜD America Inc. (Durham) is accredited to ISO/IEC 17025 by A2LA accreditation program, and has been issued certificate number 2955.18 in recognition of this accreditation. Unless otherwise specified, all tests methods described within this report are covered under the ISO/IEC 17025 scope of accreditation.

The Semi-Anechoic Chamber Test Site and Conducted Emissions Site have been fully described, submitted to, and accepted by the FCC and Innovation, Science and Economic Development (ISED) Canada.

FCC Designation Number: US1245
FCC Test Firm Registration Number: 238628
ISED Canada Company Number: 20446

2.3 Radiated Emissions Test Site Description

2.3.1 Semi-Anechoic Chamber Test Site

The Semi-Anechoic Chamber Test Site consists of a 18' x 28' x 18' shielded enclosure. The chamber is lined with Samwha Electronics Co. LTD Ferrite Absorber, model number SFA300 (HSN-1). The ferrite tile is 10cm x 10 cm and weighs approximately 1.4lbs. These tiles are mounted on steel panels and installed directly on the inner walls of the chamber. On top of the ferrite tiles is DMAS HT-45 (Dutch Microwave Absorber Solutions) hybrid absorber on all walls except the wall behind the antenna mast which has a shorter DMAS HT-25 absorber.

The turntable is 1.50m in diameter and is located 150cm from the back wall of the chamber. The chamber is grounded via 1 - 8' copper ground rod, installed at the center of the back wall, it is bound to the ground plane using short #6 copper wire. The turntable is all steel, flush mounted table installed in an all steel frame. The table is remotely operated from inside the control room located 25' from the turntable. The turntable is electrically bonded to the surrounding ground plane via steel fingers installed on the edge of the turn table. The steel fingers make constant contact with the ground plane.

Behind the turntable is a 2' x 6' x 1.5' deep shielded pit used for support equipment if necessary. The pit is equipped with 2 - 4" PVC chase from the turntable to the pit that allow for cabling to the EUT if necessary. The underside of the turntable can be accessed from the pit so cables can be supplied to the EUT from the pit.

A diagram of the Semi-Anechoic Chamber Test Site is shown in Figure 2.3-1 below:

Figure 2.3-1: Semi-Anechoic Chamber Test Site

6 EQUIPMENT UNDER TEST SETUP BLOCK DIAGRAM

Figure 6-1: Test Setup Block Diagram

7 SUMMARY OF TESTS

Along with the tabular data shown below, plots were taken of all signals deemed important enough to document.

7.1 Antenna Requirement – FCC: 15.203

The antenna is an Embedded Ceramic antenna (0.75dBi gain) that is integral to the module.

7.2 Power Line Conducted Emissions – FCC: 15.207; ISED Canada: RSS-Gen 8.8

7.2.1 Measurement Procedure

ANSI C63.10-2013 section 6 was the guiding document for this evaluation. Conducted emissions were performed from 150kHz to 30MHz with the spectrum analyzer's resolution bandwidth set to 9kHz and the video bandwidth set to 30kHz. The calculation for the conducted emissions is as follows:

Corrected Reading = Analyzer Reading + LISN Loss + Cable Loss
Margin = Applicable Limit - Corrected Reading

7.2.2 Measurement Results

The module will always operate while powered via a battery, therefore AC Mains Conducted Emissions is not required.

7.3 Peak Output Power – FCC: 15.247(b)(2); ISED Canada: RSS-247**7.3.1 Measurement Procedure (Conducted Method)**

The RF output port of the EUT was directly connected to the input of a power meter using 10.03dB of passive attenuation. The device employs <50 channels at any given time and is therefore the power is limited to 0.25W.

7.3.2 Measurement Results

Performed by: Chris Gormley

Table 7.3.2-1: RF Output Power

Frequency (MHz)	Level (dBm)	Limit (dBm)	Data Rate (kbps)
902.4	19.639	23.98	35.5
902.4	19.651	23.98	142.2
915.2	19.742	23.98	35.5
915.2	19.746	23.98	142.2
927.6	19.802	23.98	35.5
927.6	19.806	23.98	142.2

7.4 Channel Usage Requirements

7.4.1 Carrier Frequency Separation – FCC: 15.247(a)(1); ISED Canada: RSS-247

7.4.1.1 Measurement Procedure

The RF output port of the EUT was connected via 10.03dB of passive attenuation to the input of the spectrum analyzer. The span of the spectrum analyzer was set wide enough to capture two adjacent peaks and the RBW was set to approximately 30% of the channel spacing and adjusted as necessary to best identify the center of each individual channel. The VBW was set to $\geq$ RBW.

7.4.1.2 Measurement Results

Performed by: Chris Gormley

Figure 7.4.1.2-1: Carrier Frequency Separation – 35.5kbps

09:24:39 12.10.2020

Figure 7.4.1.2-2: Carrier Frequency Separation – 142.2kbps

7.4.2 Number of Hopping Channels – FCC: 15.247(a)(1)(i); ISED Canada: RSS-247

7.4.2.1 Measurement Procedure

The RF output port of the EUT was connected via 10.03dB of passive attenuation to the input of the spectrum analyzer. The span of the spectrum analyzer was set wide enough to capture the frequency band of operation. The RBW was set to less than 30% of the channel spacing and VBW set to $\geq$ RBW.

The EUT operates using multiple 25 channel hopping tables within the range 902.4 – 927.6 MHz. Only one hopping table was chosen for this evaluation to show compliance with the number of hopping channels.

7.4.2.2 Measurement Results

Performed by: Chris Gormley

Figure 7.4.2.2-1: Number of Hopping Channels – 35.5kbps

Figure 7.4.2.2-2: Number of Hopping Channels – 142.2kbps

7.4.3 Channel Dwell Time – FCC: 15.247(a)(1)(i); ISED Canada: RSS-247

7.4.3.1 Measurement Procedure

The RF output port of the EUT was connected via 10.03dB of passive attenuation to the input of the spectrum analyzer. The span of the spectrum analyzer display was set 0 Hz centered on a hopping channel. The RBW of the spectrum analyzer was set to 100kHz and VBW set to $\geq$ RBW. The Marker Delta function of the analyzer was utilized to determine the dwell time.

7.4.3.2 Measurement Results

Performed by: Chris Gormley

Table 7.4.3.2-1: Channel Dwell Time

Data Rate (kbps)	Single Occurrence	Number of Occurrences	Total Dwell Time (ms)	Evaluation Period (s)
35.5	99.650	2	199.3	10
142.2	26.6	7	186.2	10

Figure 7.4.3.2-4: Dwell Time – 142.2kbps – Number of Occurrences

7.4.4 20dB / 99% Bandwidth – FCC: 15.247(a)(1)(i), ISED Canada: RSS-247**7.4.4.1 Measurement Procedure**

The RF output port of the EUT was connected via 10.03dB of passive attenuation to the input of the spectrum analyzer. The span of the spectrum analyzer display was set between two times and five times the occupied bandwidth (OBW) of the emission. The RBW of the spectrum analyzer was set to approximately 1 % to 5 % of the OBW. The trace was set to max hold with a peak detector active. The Delta and ndB down functions of the analyzer were utilized to determine the 20 dB bandwidth of the emission.

The occupied bandwidth measurement function of the spectrum analyzer was used to measure the 99% bandwidth. The span of the analyzer was set to capture all products of the modulation process, including the emission sidebands. The resolution bandwidth was set to 1% to 5% of the occupied bandwidth. The video bandwidth was set to 3 times the resolution bandwidth.

7.4.4.2 Measurement Results

Performed by: Randle Sherian or Jean Tezil

7.5 Band-Edge Compliance and Spurious Emissions

7.5.1 Band-Edge Compliance of RF Conducted Emissions – FCC: 15.247(d); ISED Canada RSS-247

7.5.1.1 Measurement Procedure

The RF output port of the EUT was connected via 10.03dB of passive attenuation to the input of the spectrum analyzer. The EUT was investigated at the lowest and highest channel available to determine band-edge compliance. For each measurement the spectrum analyzer's RBW was set to 100 kHz, and the VBW was set to >> RBW.

7.5.2 RF Conducted Spurious Emissions – FCC: 15.247(d); ISED Canada RSS-247

7.5.2.1 Measurement Procedure

The RF output port of the EUT was connected via 10.03dB of passive attenuation to the input of the spectrum analyzer. The EUT was investigated for conducted spurious emissions from 30MHz to 10GHz, 10 times the highest fundamental frequency. Measurements were made at the low, center and high channels of the EUT. For each measurement, the spectrum analyzer's RBW was set to 100kHz. A peak detector function was used with the trace set to max hold.

7.5.3 Radiated Spurious Emissions – FCC: 15.205, 15.209; ISED Canada RSS-247, RSS-Gen 8.9/8.10

7.5.3.1 Measurement Procedure

Radiated emissions tests were made over the frequency range of 30MHz to 10GHz, 10 times the highest fundamental frequency.

The EUT was rotated through 360° and the receive antenna height was varied from 1m to 4m so that the maximum radiated emissions level would be detected. For frequencies below 1000MHz, quasi-peak measurements were made using a resolution bandwidth RBW of 120 kHz and a video bandwidth VBW of 300 kHz. For frequencies above 1000MHz, peak and average measurements were made with RBW and VBW of 1 MHz and 3MHz respectively. The average emissions were further corrected by applying the duty cycle correction of the EUT for comparison to the average limit.

Each emission found to be in a restricted band as defined by section 15.205, including any emission at the operational band-edge, was compared to the radiated emission limits as defined in section 15.209.

7.5.3.2 Duty Cycle Correction

No duty cycle correction was used.

7.5.3.3 Measurement Results

Performed by: Chris Gormley

Figure 7.5.3.3-1: Radiated Spurious Emissions Prescan – 30MHz to 1GHz

Figure 7.5.3.3-2: Radiated Spurious Emissions Prescan – Above 1GHz

7.5.3.4 Sample Calculation:

$$R_C = R_U + CF_T$$

Where:

CF_T	=	Total Correction Factor (AF+CA+AG)-DC (Average Measurements Only)
R_U	=	Uncorrected Reading
R_C	=	Corrected Level
AF	=	Antenna Factor
CA	=	Cable Attenuation
AG	=	Amplifier Gain
DC	=	Duty Cycle Correction Factor

Example Calculation: Peak

Corrected Level: $36.90 - 10.98 = 47.88\text{dBuV/m}$

Margin: $74\text{dBuV/m} - 47.88\text{dBuV/m} = 26.12\text{dB}$

Example Calculation: Average

Corrected Level: $23.60 - 10.98 = 34.58\text{dBuV}$

Margin: $54\text{dBuV} - 34.58\text{dBuV} = 19.42\text{dB}$

8 MEASUREMENT UNCERTAINTY

The expanded laboratory measurement uncertainty figures (U_{Lab}) provided below correspond to an expansion factor (coverage factor) $k = 1.96$ which provide confidence levels of 95%.

Parameter	U_{lab}
Occupied Channel Bandwidth	$\pm 0.004\%$
RF Conducted Output Power	$\pm 0.689 \text{ dB}$
Power Spectral Density	$\pm 0.5 \text{ dB}$
Antenna Port Conducted Emissions	$\pm 2.717 \text{ dB}$
Radiated Emissions	$\pm 5.877 \text{ dB}$
Temperature	$\pm 0.860 \text{ }^{\circ}\text{C}$
Radio Frequency	$\pm 2.832 \times 10^{-8}$
AC Power Line Conducted Emissions	± 2.85

9 CONCLUSION

In the opinion of TÜV SÜD America Inc. the NXCM, manufactured by Elster Solutions LLC meets the requirements of FCC Part 15 subpart C and ISED Canada's Radio Standards Specification RSS-247 for the tests documented herein.
