2.3 Product Feature of Equipment Under Test

Product Name	Smartphone
Marketing Name	N/A
Model Name	CP3669AS
Sample Status	Production
Operating Frequency Range	814MHz~824MHz
Type of Wireless Technology	FDD LTE - Band 26
Modulation Type	QPSK, 16QAM, 64QAM
Channel Bandwidth	1.4MHz, 3MHz, 5MHz, 10MHz
Antenna Type	Internal Antenna
Antenna Gain	-5dBi
Extreme Operating Temperature	Minimum: -10℃
	Maximum: +55℃
Power Supply	Normal Voltage: 3.60V
	Lowest Voltage: 3.85V
	Highest Voltage: 4.40V
Hardware Version	P0
Software Version	10.0.047.P0.200914.CP3669AS
Sample Received Date	2020/8/24

2.4 Ancillary Equipment

The EUT has been tested as an independent unit together with other necessary accessories or support units. The following ancillary equipment were used to form a representative test configuration during the tests.

Support Unit	Li-Lon Polymer Rechargeable Battery
Manufacturer	Zhongshan Tianmao Battery Co. Ltd.
Model Name	CPLD-438
Capacity	3400mAh
Nominal Voltage	3.85V
Serial Number	CPTT60000058807C005E

2.5 Description of Test Modes

The EUT was linked by base station simulator to work in continuous transmitting and receiving mode. Pre-Scan has been conducted to determine the worst-case mode from all possible combinations between available modulations, bandwidth, resource block (RB) and RB offset.

Following channels were selected for test:

Channel Bandwidth	Low Channel		Mid Channel		High Channel	
	Frequency (MHz)	Channel No.	Frequency (MHz)	Channel No.	Frequency (MHz)	Channel No.
1.4MHz	814.7	26697	819.0	26740	823.3	26783
3MHz	815.5	26705	819.0	26740	822.5	26775
5MHz	816.5	26715	819.0	26740	821.5	26765
10MHz	---		819.0	26740	---	

Following modes were selected as the worst case configuration for each test:

3 Test Result

3.1 RF Output Power

3.1.1. Limit

FCC 47 CFR Part 90 Subpart S - §90.635(b)

The maximum output power of the transmitter for mobile station is 100 watts (20dBw).

3.1.2. Test Setup

3.1.3. Test Procedures

- 1) The measurement procedure follows ANSI C63.26-2015, clause 5.2.
- 2) The RF output of EUT and BS simulator are connected via a sufficient attenuation.
- 3) EUT is configured to transmit the maximum output power while the measurement is performed.

3.1.5. Uncertainty

$$U_{lab}=1.48\text{dB } (k=2)$$

3.2 Peak to Average Power Ratio (PAPR)

3.2.1. Limit

In measuring transmissions in this band using an average power technique, the peak-to-average ratio (PAR) of the transmission may not exceed 13dB.

3.2.2. Test Setup

3.2.3. Test Procedures

- 1) The measurement procedure follows ANSI C63.26-2015, clause 5.2.6.
- 2) The RF output of the EUT, BS simulator and spectrum analyzer are connected via a power divider.
- 3) Measure the total peak power and record as P_{pk} .
- 4) Measure the total average power and record as P_{Avg} .
- 5) Calculate the PAPR from: $PAPR (dB) = P_{pk} (dBm) - P_{Avg} (dBm)$.

3.3 Effective Radiated Power

3.3.1. Limit

FCC 47 CFR Part 90 Subpart S - §90.635 (b)

The maximum output power of the transmitter for mobile station is 100 watts (20dBm).

3.3.2. Test Setup

3.3.3. Test Procedures

- 1) The measurement procedure follows ANSI C63.26-2015, clause 5.2.7.
- 2) Connect the equipment as illustrated. Mount the equipment with the manufacturer specified antenna in a vertical orientation on a manufacturer specified mounting surface located on a non-conducting rotating platform of a RF anechoic chamber (preferred) or a standard radiation site.
- 3) Key the transmitter, then rotate the EUT 360° azimuthally and record spectrum analyzer power level (LVL) measurements at angular increments that are sufficiently small to permit resolution of all peaks. If a standard radiation test site is used, raise and lower the test antenna to obtain a maximum reading at each angular increment. (Note: several batteries may be needed to offset the effect of battery voltage droop, which should not exceed 5% of the manufactured specified battery voltage during transmission).
- 4) Replace the transmitter under test with a vertically polarized half-wave dipole (or an antenna whose gain is known relative to an ideal half-wave dipole). The center of the antenna should be at the same location as the center of the antenna under test.
- 5) Connect the antenna to a signal generator with a known output power and record the path loss (in dB) as LOSS. If a standard radiation test site is used, raise and lower the test antenna to obtain a maximum reading. $LOSS = \text{Generator Output Power (dBm)} - \text{Analyzer reading (dBm)}$.
- 6) Determine the effective radiated output power at each angular position from the readings in steps 2) and 4) using the following equation: $ERP \text{ (dBm)} = LVL \text{ (dBm)} + LOSS \text{ (dB)}$
- 7) The maximum ERP is the maximum value determined in the preceding step.
- 8) When calculating ERP, in addition to knowing the antenna radiation and matching characteristics, it is necessary to know the loss values of all elements (e.g. transmission line attenuation, mismatches, filters, combiners) interposed between the point where transmitter output power is measured, and the point where power is applied to the antenna. ERP can then be calculated as follows:

$$EIRP \text{ (dBm)} = \text{Output Power (dBm)} - \text{Losses (dB)} + \text{Antenna Gain (dBi)}$$

where: dB refers to gain relative to an ideal dipole.

$$EIRP \text{ (dBm)} = ERP \text{ (dBm)} + 2.15 \text{ (dB)}$$

The RB allocation refers the configuration of maximum output power.

3.4 Occupied Bandwidth

3.4.1. Limit

FCC 47 CFR Part 90 Subpart S - §90.209 (a)

Each authorization issued to a station licensed under this part will show an emission designator representing the class of emission authorized. The designator will be prefixed by a specified necessary bandwidth. This number does not necessarily indicate the bandwidth occupied by the emission at any instant. In those cases where §2.202 of this chapter does not provide a formula for the computation of necessary bandwidth, the occupied bandwidth, as defined in part 2 of this chapter, may be used in lieu of the necessary bandwidth.

3.4.2. Test Setup

3.4.3. Test Procedures

- 1) The measurement procedure follows ANSI C63.26-2015, clause 5.2.7
- 2) The RF output of the EUT, BS simulator and spectrum analyzer are connected via a power divider.
- 3) The nominal RBW of spectrum analyzer shall be in the range of 1% to 5% of the anticipated OBW, and the VBW shall be set $\geq 3 \times \text{RBW}$.
- 4) Record the measured results of 26dB and 99% bandwidth.
