

Response to TCB Findings

1. Has the device complied with 15.31(e) (fundamental level vs voltage variation) requirement?

During 15.225e and 15.31e testing, no changes in power level or output were seen.

2. The label document mentions "removable paper" in the adhesive description. Does this mean that the label is not permanent and can be removed? Please clarify.

The term "removable paper" only applies to the protective cover of the adhesive. Once removed, the adhesiveness of the label may now be attached to the product. This then makes the label "irremovable" through normal installation and use.

This response references all 5 labels of the OmniSmart Series of products.
