Sample Receipt Date: 21 May 04
Sample Test Date: see data sheets

Test Report Number: 04F327B
Model Designation: 120A, 510, 302
Product Description: Alarm Transmitters
Marketing Approval _____

Description of non-standard test method or test practice: *None*

Estimated Measurement Uncertainty: *Not Applicable*

Special limitations of use: *None*

Traceability: *reference standards of measurement have been calibrated by a competent body using standards traceable to the NIST.*

According to testing performed at Product Safety Engineering, Inc., the above-mentioned unit is in compliance with the electromagnetic compatibility requirements defined in regulations indicated on page (3) of the test report. The test results contained herein relate only to the model(s) identified above. It is the manufacturer's responsibility to assure that additional production units of this model are manufactured with identical electrical and mechanical characteristics.

As the responsible EMC Project Engineer, I hereby declare that the equipment tested as specified above conforms to the requirements indicated on page (3) of the test report.

GENERAL REMARKS:

The EUT's were tested in (3) orthogonal positions. The EUT automatically transmits less than (2) seconds per hour unless there is a pending emergency. There are (3) models being submitted under one application. All (3) models are schematically identical with respect to the transmitter. They will share a single FCC identifier.

SUMMARY:

The requirements according to the technical regulations are

■ - met

□ - **not** met.

The device under test does

■ - fulfill the general approval requirements mentioned on page 3.

□ - **not** fulfill the general approval requirements mentioned on page 3.

Measurement Protocol

The test methodology followed during the collection of the data included within this technical report was ANSI C63.4:1992.

The EUT was powered from internal battery during the collection of data included within.

The "unintentional radiator" data below is compared to the FCC Part 15 Class B "digital device" limits.

The "EMI" instrumentation is capable of calculating the final emission level based on the following formula:

Level at the receiver (dB μ V) + Antenna Correction Factor (dB/M) + Cable Loss (dB) - Preamp Gain (dB) = Actual Level in dB μ V/M.

The sample calculation below is based on the actual test data collected:

Observed Level		94.3	dB μ V	
ACF	+	14.3	dB/M	
Cable Loss	+	2.0	dB	
Preamp Gain	-	26.0	dB	
Actual Level		84.5	dB μ V/M	@ 292.5 MHz
