Section 1. Summary of Test Results

General

All measurements are traceable to national standards.

These tests were conducted on a sample of the equipment for the purpose of demonstrating compliance with Part 15, Subpart E. Radiated tests were conducted in accordance with ANSI C63.4-1992. Radiated emissions are made on an open area test site. A description of the test facility is on file with the FCC.

THIS TEST REPORT RELATES ONLY TO THE ITEM(S) TESTED.

THE FOLLOWING DEVIATIONS FROM, ADDITIONS TO, OR EXCLUSIONS FROM THE
TEST SPECIFICATIONS HAVE BEEN MADE.

Section 3. RF Exposure Evaluation

- (1) This U-NII Band radio module will be integrated into an enclosure with FCC approved access radio module FCC ID# RAR20000001. Co-location compliance for multiple frequency exposure criteria to the power density exposure limit is detailed in the table below.
- (2) The antenna(s) used with this device are integral and will be installed to provide a minimum separation distance of 20cm from all persons and will not be co-located or operated in conjunction with any other antenna or transmitter not described in this application.
- (3) This integrated modular transmitter will only be operated according to the exposure conditions described in this application. End users and installers will be provided with antenna installation and transmitter operating conditions for satisfying RF exposure compliance.

0.5966	0.1336	0.1336	0.1336	0.9974	1.0	PASS

The typical worst case transmitter duty cycle is 95%. Therefore the conducted power has been corrected from 100% to 95% to address RF exposure.

802.11b Radio

Maximum conducted power = 423.3mW @ a transmitter duty cycle of 95% & cable loss of 0.5dB. Antenna gain = 8.5dBi, therefore the power density at 20cm = 0.5966mW/cm².

802.11a Radio

Maximum conducted power = 21.2mW @ a transmitter duty cycle of 95% & cable loss of 0.5dB. Antenna gain = 15dBi, therefore the power density at 20cm = 0.1336mW/cm².

Note: This calculation includes the 0.5dB in cable loss from the RF port to the antenna.

Measurement Data: See attached plots and table.

- Emissions were searched for all possible configurations. Worst case data has been presented.
- The DUT was searched from 30MHz to the 10th harmonic. Only those emissions within 20dB of the limit were reported.
- Bandedge emissions were measured at the lowest and highest operating frequencies.
- The power supply source was varied +/-15% to verify worst case emissions.
- Where necessary radiated emissions search were performed at 1 meter to achieve receiver sensitivity.
