1 ADMINISTRATIVE DATA

1.1 Certifications and Qualifications

I certify that DNB Engineering, Inc conducted the tests performed in order to obtain the technical data presented in this application. Also, based on the results of the enclosed data, I have concluded that the equipment tested meets or exceeds the requirements of the Rules and Regulations governing this application.

DNB Engineering's Riverside 3 and 10 meter sites have been registered with the Federal Communication Commission per the requirements of Section 2.948 of the FCC Rules:

FCC Registration No. 99985

1.2 Measurement Reputability Information

The test data presented in this report has been acquired using the guidelines set forth in FCC Part 2.1031 through 2.1057, and were applicable to Part 90(see sec Test Data Required for specifics). The test results presented in this document are valid only for the equipment identified herein under the test conditions described. Repeatability of these test results will only be achieved with identical measurement conditions. These conditions include: The same test distance, EUT Height, Measurement Site Characteristics, and the same EUT System Components. The system must have the same Interconnecting Cables arranged in identical placement to that in the test set-up, with the system and/or EUT functioning in the identical mode of operation (i.e. software and so on) as on the date of the test. Any deviation from the test conditions and the environment on the date of the test may result in measurement repeatability difficulties.

All changes made to the EUT during the course of testing as identified in this test report must be incorporated into the EUT or identical models to ensure compliance with the FCC regulations.

C. L. Payne III (Para. 1.1)
Manager, Commercial Products.

1.5 Deviations

Deviations/Modifications to the EUT

None

Deviations/Modifications from test standard.

None

1.6 Test Description 2.1033 (b) (6)

1.6.1 RF Power Output

Per 2.1046

- (a) For transmitters other than single sideband, independent sideband and controlled carrier radiotelephone, power output shall be measured at the RF output terminals when the transmitter is adjusted in accordance with the tune-up procedure to give the values of current and voltage on the circuit elements specified in Sec. 2.1033(c)(8). The electrical characteristics of the radio frequency load attached to the output terminals when this test is made shall be stated.
- (b) (b) For single sideband, independent sideband, and single channel, controlled carrier radiotelephone transmitters the procedure specified in paragraph (a) of this section shall be employed and, in addition, the transmitter shall be modulated during the test as follows. In all tests, the input level of the modulating signal shall be such as to develop rated peak envelope power or carrier power, as appropriate, for the transmitter.

1.6.2 Modulation Characteristics

Per 2.1047 (d)

A curve or equivalent data which shows that the equipment will meet the modulation requirements of the rules under which the equipment is to be licensed.

1.6.3 Occupied Bandwidth

Per 2.1049

1.6.4 Spurious Emissions at Antenna Terminals

Per 2.1051

The radio frequency voltage or powers generated within the equipment and appearing on a spurious frequency shall be checked at the equipment output terminals when properly loaded with a suitable artificial antenna. Curves or equivalent data shall show the magnitude of each harmonic and other spurious emission that can be detected when the equipment is operated under the conditions specified in Sec. 2.1049 as appropriate. The magnitude of spurious emissions which are attenuated more than 20 dB below the permissible value need not be specified.

1.6.5 Field Strength of Spurious radiation

Per 2.1053

Measurements shall be made to detect spurious emissions that may be radiated directly from the cabinet, control circuits, power leads, or intermediate circuit elements under normal conditions of installation and operation. Curves or equivalent data shall be supplied showing the magnitude of each harmonic and other spurious emission. For this test, single sideband, independent sideband, and controlled carrier transmitters shall be modulated under the conditions specified in paragraph (c) of Sec. 2.1049, as appropriate. For equipment operating on frequencies below 890 MHz, an open field test is normally required, with the measuring instrument antenna located in the far-field at all test frequencies. In the event it is either impractical or impossible to make open field measurements (e.g. a broadcast transmitter installed in a building) measurements will be accepted of the equipment as installed. Such measurements must be accompanied by a description of the site where the measurements were made showing the location of any possible source of reflections which might distort the field strength measurements. Information submitted shall include the relative radiated power of each spurious emission with reference to the rated power output of the transmitter, assuming all emissions are radiated from halfwave dipole antennas.

1.6.6 Frequency Stability

Per 2.1055

The frequency stability shall be measured with variation of ambient temperature. Frequency measurements shall be made at the extremes of the specified temperature range and at intervals of not more than 10° centigrade through the range. A period of time sufficient to stabilize all of the components of the oscillator circuit at each temperature level shall be allowed prior to frequency measurement. The short term transient effects on the frequency of the transmitter due to keying (except for broadcast transmitters) and any heating element cycling normally occurring at each ambient temperature level also shall be shown. Only the portion or portions of the transmitter containing the frequency determining and stabilizing circuitry need be subjected to the temperature variation test.

3 2.1033 (b) 14: Test Data

3.1 Test Result Summery

Figure 2: Test Result Summary

NAME OF TEST	FCC PARA. NO.	RESULTS
RF Power Output	2.1046, 90.219	Complies
Modulation Characteristics	2.1047	Complies
Occupied Bandwidth: TDMA/GSM	2.1049, 90.209	Complies
Conducted Spurious Emissions at Antenna Terminals	2.1051, 90.210	Complies
Radiated Field Strength of Spurious Emissions	2.1053, 90.210	Complies
Frequency Stability	2.1055	NA

3.1.2 Frequency Spectrum Investigated

Per 2.1057

In all of the measurements set forth in Secs. 2.1051 and 2.1053, for equipment operating below 10 GHz, the spectrum shall be investigated from the lowest radio frequency signal generated in the equipment, without going below 9 kHz, to the tenth harmonic of the highest fundamental frequency or to 40 GHz, whichever is lower.

3.2 Test Setup Photo

3.3 Test Block Diagram

Figure 3: Test Set up Block Diagram for RF Power Output, Emissions Limitations GSM/TDMA, Occupied Bandwidth GSM/TDMA, Conducted Spurious Emissions at Antenna Terminals.

3.4 RF Power Output

Per 2.1046, 90.219

Definition: Nextel Amplifier

Test Method: See FIGURE 3.

Output Power is measured across a precision 50 ohm load with a Spectrum Analyzer. For the power measurement, CW (no modulation) is used.

Test Results:

POWER OUTPUT MEASURED AT NOMINAL VOLTAGE WAS:

<u>Frequency (MHz)</u>	<u>Power (dBm)</u>	<u>Power (W)</u>
806	22.5	178mW
815.5	23.3	214mW
825	21.9	123mW
851	10.6	1mW
860.5	12.5	18mW
870	12.7	18.6mW

3.5 Modulation Characteristics

Per 2.1047 (d)

The EUT is compliant as seen in Occupied Bandwidth data input and output signals. The amplified signal does not distort the modulation.

3.6 Occupied Bandwidth

Per 2.1049, 90.209

Definition:

Occupied Bandwidth, that is the frequency bandwidth such that, below its lower and above its upper frequency limits, the mean powers radiated are equal to 0.5 percent of the total mean power radiated by a given emission.

Test Method: Connect the Equipment per FIGURE 3.

Measurements were made while modulating the driving source with specified modulations.

Test Results: See Plots

Description:	Nextel Amplifier		
	Output Downlink 5.8-10GHz		

3.7 Spurious Emissions at Antenna Terminals.

Per 2.1051

Definition:

Conducted Spurious Emissions are emissions at the antenna terminals on a frequency or frequencies which are outside an occupied band sufficient to ensure transmission of information of required quality for the class of communication desired. The reduction in the level of these spurious emissions will not affect the quality of the information being transmitted.

Conducted Spurious Emissions shall be attenuated below the maximum level of the carrier frequency in accordance with the following formula:

$$-13\text{dB} = \text{Measured Power} - (43 + 10 \log_{10} (\text{Rated Power}))$$

Test Method: Per EIA RS 152-B, Paragraph 4 as modified below.

Connect the equipment as shown in FIGURE 3.

Adjust the drive source to produce FM modulation. Adjust the Spectrum Analyzer to display the Modulated Carrier.

Scan the frequency spectrum from the lowest radio frequency generated in the equipment through the 10th harmonic of the carrier frequency.

Test Results: See Plots

All spurious emissions at the antenna terminals are below the FCC specifications

3.8 Field Strength of Spurious Radiation

Per 2.1053

Definition:

Emissions from the equipment when connected into a non-radiating load on a frequency or frequencies which are outside an occupied band sufficient to ensure transmission of information of required quality for the class of communication desired. The reduction in the level of these spurious emissions will not affect the quality of the information being transmitted.

Test Method: Per TIA /EIA 603.

Connect the equipment and follow the procedure described in TIA/EIA 603 for radiated spurious emissions. Measure the amplitude of each spurious radiated signal through the 10th harmonic. The spurious signals are then measured on the 3 meter range. First the EUT is measured using a tuned reference dipole below 1GHz and a double ridge guide Horn antenna above 1GHz. If the DRG antenna is used the appropriate gain factor for the antenna is subtracted from the final measurement. Then a dipole to dipole (or drg to drg) measurement is conducted to determine the actual power at each harmonic being generated by the EUT. If no noticeable emission can be observed the ground floor is recorded in the data sheets.

Test Results: All readings were at the spectrum analyzer ground floor above the fundamental.

All radiated spurious emissions are below the FCC Specifications.

Formula for calculated spurious emissions.

Corrected reading (dBm) = Reading (dBm) + Antenna Gain (in dB)

Where reading is the measured power at the transmit antenna directly measured with a power meter

3.8.1 RF Exposure – MPE Calculations

Input

Transmitter Power: 250 mW

Antenna Gain: 3 dB

Cable loss: 2 dB @ 806– 825 MHz
2 dB @ 851 – 870 MHz

Frequency range: 806-825 MHz and MHz

Assumptions

1. A single $\frac{1}{4}$ wavelength radiating antenna is assumed.
2. Closest exposure distance is assumed to be 20 cm

RF Exposure – MPE Calculations

Calculations

The following results shall be assumed to be accurate for the far-field only. These predictions will over-estimate power density in the near-field. Based on the use of a $\frac{1}{4}$ wavelength radiator, a distance of 20 cm is considered to be in the far-field for all cases.

$$S = PG/4\pi R^2$$

@ 806-825 MHz

P is 250mW

G is 2 dB (Antenna gain – loss) or $10^{(2/20)}$ or 1.25

R is 20 cm

$$\underline{S = 0.056 \text{ mW/cm}^2}$$

For Occupational/Controlled Exposure

From 300 to 1500 MHz, power density limit is $f/300 \text{ mW/cm}^2$

@ 806MHz, power density limit is 2.69 mW/cm^2

For General Population/Uncontrolled Exposure

From 300 to 1500 MHz, power density limit is $f/1500 \text{ mW/cm}^2$

@ 806MHz, Power density limit is 0.54 mW/cm^2

Conclusion: Meets MPE limits

3.9 Frequency Stability

Per 2.1055

Definition:

The measurement of frequency stability with variation of the ambient temperature.

Test Method: Frequency measurements shall be made at the extremes of the specified temperature range and at intervals of not more than 10[deg] centigrade through the range. A period of time sufficient to stabilize all of the components of the oscillator circuit at each temperature level shall be allowed prior to frequency measurement.

Test Results: Not Applicable
