TEST REQUIREMENT	
Systems operating under the provisions of this section shall be operated in a manner that ensures that the public is not exposed to radio frequency energy levels in excess of the Commission's guidelines § 1.1310.	
EUT classification (fixed, mobile or portable devices)	Fixed according to § 2.1091(b) of this Chapter
LIMITS	According to Table 1 to §1.1310(e)(1) — Limits for Maximum Permissible Exposure (MPE)
Testing dates	2023-01-18

TABLE 1 TO §1.1310(E)(1) — LIMITS FOR MAXIMUM PERMISSIBLE EXPOSURE (MPE)

300-1,500			f/1500	<30
1,500-100,000			1.0	<30

f = frequency in MHz. * = Plane-wave equivalent power density.

The power density at any given distance in any direction can be calculated in the far field using the following equation:

$$S = PG_i / (4\pi r^2)$$

where:

S: power density (W/m²) in a given direction.

P: power (W) supplied to the radiation source, assuming a lossless system;

G_i: gain factor of the radiation source in the relevant direction, relative to an isotropic radiator;

r: distance (m) from the radiation source.

The product **PG_i** in equation is known as the e.i.r.p. which represents the power that a fictitious isotropic radiator would have to emit in order to produce the same field intensity at the receiving point.
