

Statement for RF Exposure

Statement No.	14862956H-R1
Customer	Keyence Corporation
Description of EUT	Level sensor
Model Number of EUT	FR-LMH20L / FR-LM20L
FCC ID	RF41754C
Test standard	FCC Part 15 Subpart C
Test result	Complied

[FCC rule]

§1.1310 Radiofrequency radiation exposure limits.

The criteria listed in table 1 shall be used to evaluate the environmental impact of human exposure to radiofrequency (RF) radiation as specified in §1.1307(b), except in the case of portable devices which shall be evaluated according to the provisions of §2.1093 of this chapter.

Table 1—Limits for Maximum Permissible Exposure (MPE)

Frequency range (MHz)	Electric field strength (V/m)	Magnetic field strength (A/m)	Power density (mW/cm ²)	Averaging time (minutes)
(A) Limits for Occupational/Controlled Exposures				
0.3–3.0	614	1.63	*(100)	6
3.0–30	1842/f	4.89/f	*(900/f ²)	6
30–300	61.4	0.163	1.0	6
300–1500			f/300	6
1500–100,000			5	6
(B) Limits for General Population/Uncontrolled Exposure				
0.3–1.34	614	1.63	*(100)	30
1.34–30	824/f	2.19/f	*(180/f ²)	30
30–300	27.5	0.073	0.2	30
300–1500			f/1500	30
1500–100,000			1.0	30

f = frequency in MHz

* = Plane-wave equivalent power density

Note 1 to Table 1: Occupational/controlled limits apply in situations in which persons are exposed as a consequence of their employment provided those persons are fully aware of the potential for exposure and can exercise control over their exposure. Limits for occupational/controlled exposure also apply in situations when an individual is transient through a location where occupational/controlled limits apply provided he or she is made aware of the potential for exposure.

Note 2 to Table 1: General population/uncontrolled exposures apply in situations in which the general public may be exposed, or in which persons that are exposed as a consequence of their employment may not be fully aware of the potential for exposure or can not exercise control over their exposure.

[About fundamental measurement (Average)]

Test Procedure

The test was performed based on "Procedures for testing millimeter-wave systems" of ANSI C63.10-2013. The peak power were measured with an RF detector that has a detection bandwidth that encompasses the 57-71 GHz band and has a video bandwidth of at least 10 MHz.

The carrier levels were measured in the far field. The distance of the far field was calculated from follow equation.

$$r = \frac{2D^2}{\lambda}$$

where

r is the distance from the radiating element of the EUT to the edge of the far field, in m
 D is the largest dimension of both the radiating element and the test antenna (horn), in m
 λ is the wavelength of the emission under investigation [300/f (MHz)], in m

Frequency [GHz]	Wavelength λ [mm]	Maximum Dimention			Far Field Boundary r [m]	Tested Distance [m]
		EUT [m]	Test Antenna [m]	Maximum D [m]		
63	4.8	0.03710	0.03759	0.03759	0.594	0.65

The test was performed based on stages 1-4 following;

Stage 1:

Connect the measurement antenna for the fundamental frequency band to the mm-wave RF detector.
 Place the measurement antenna at a test distance that is in the far-field of the measurement antenna.
 Place the measurement antenna in the main beam of the EUT then maximize the fundamental emission.
 The maximum direction was searched under carefully since beam-widths are extremely narrow.
 Record the peak voltage from DSO as DSO Reading.

Stage 2:

Disconnect the measurement antenna from the RF input port of the instrumentation system.
 Connect a mm-wave source to the RF input port of the instrumentation system via a waveguide variable attenuator.
 The mm-wave source shall be unmodulated.
 Adjust the frequency of the mm-wave source to the center of the frequency range occupied by the transmitter.
 Adjust the amplitude of the mm-wave source and/or the variable attenuator such that the DSO indicates a voltage equal to the peak voltage recorded in Stage 1.
 The output level of mm-wave source at this time is recorded as SG Reading.

Stage 3:

Disconnect the waveguide variable attenuator from the RF input port of the instrumentation system.
 Without changing any settings, connect the waveguide variable attenuator to a wideband mm-wave power meter with a thermocouple detector or equivalent.
 Measure the power and record it as PM reading.

Stage 4:

Correct the peak substitution power at the input to the measurement instrument, as recorded in Stage 3, for any external gain and/or attenuation between the measurement antenna and the measurement instrument that was not included in the substitution power measurement.

The test results and limit are rounded off to one decimal place, so some differences might be observed.

Calculating formula:

FSL (Free Space path Loss) = $10 \cdot \log_{10}((4 \cdot \pi \cdot \text{Tested Distance} / \text{Lambda})^2)$

EIRP (Burst Average) = P/M Reading - Rx Ant. Gain - LNA Gain + FSL

EIRP (Timed Average) = EIRP (Burst Average) - Duty Factor

*1) Duty Factor

Tx ON+OFF Time [ms]	Tx ON Time [ms]	Duty Factor [dB]
139.997	2.059	18.33

Calculating formula:

Duty factor = $10 \cdot \log (\text{Tx ON} + \text{OFF Time} / \text{Tx ON Time})$

*1) Refer to Duty Cycle data page.

*Hyphens for Last Calibration Date and Cal Int (month) are instruments that Calibration is not required (e.g. software), or instruments checked in advance before use.

The expiration date of the calibration is the end of the expired month.

As for some calibrations performed after the tested dates, those test equipment have been controlled by means of an unbroken chains of calibrations.

All equipment is calibrated with valid calibrations. Each measurement data is traceable to the national or international standards.

Test item:

MPE: Maximum Permissible Exposure

[Results]

Mode	Average EIRP* [mW]	Separation Distance [cm]	Power Density	
			Result [mW/cm ²]	Limit [mW/cm ²]
Average Power	2.22	20	0.0004	1

Calculating formula:

$$\text{Power Density} = \text{Average EIRP} / (4 * \pi * \text{Separation Distance}^2)$$

This EIRP was measured in sufficient far field of 0.65 m distance and calculated at 20 cm.

Even the RF Specification EIRP, the power density is below the RF Exposure Limit of 1 mW/cm².
