Note: The product will always employ a hopping table of 83 channels. At the time that these measurements were taken, five different “random” hopping tables had been prepared. The hopping tables could be different in the final version of the product due to restrictions on the lowest and highest channel allowed (based on low/high band edge measurements).

Time of Occupancy (Dwell Time)

REQUIREMENT

"The average time of occupancy on any channel shall not be greater than 0.4 seconds within a period of 0.4 seconds multiplied by the number of hopping channels employed" [15.247(a)(1)(iii)]

$$0.4s * 83 = 33.2s$$

MEASUREMENTS

Individual dwell time = 0.025s

Number of individual dwells within a 33.2s window = 8 (see plot on following page)

Total dwell time within 33.2s = $0.025s * 8 = 0.2s$

Note: Based on the measurements in this section, the highest power level setting allowed is 1470.

Output Power Settings

REQUIREMENT

"Systems operating in the 2400-2483.5 MHz band that are used exclusively for fixed, point-to-point operations may employ transmitting antennas with directional gain greater than 6dBi provided the maximum peak output power of the intentional radiator is reduced by 1 dB for every 3 dB that the directional gain of the antenna exceeds 6 dBi." [15.247(4)(i)]

RESULTS

Three types of antennas are supported by this product: omnidirectional, yagi, and parabolic. There are two of each type available, with the highest directional gains being 6dBi, 16dBi, and 24dBi respectively. The highest power setting for the 6dBi omnidirectional antenna was determined to be **1470** in the previous section. The output power for the 16dBi Dual-Yagi must be 3.3dB lower than the maximum (power setting = **1395**), and the output power for the 24dBi Parabolic must be 6dB lower than the maximum (power setting = **1350**). See plot below.

ANALYZER PLOT

Conducted Spurious Emissions

LIMIT

Peak: 20dB down from fundamental [15.247(c)]

MEASUREMENTS

No conducted spurious emissions were detected. See the plots below.
