FCC & IC EVALUATION REPORT FOR CERTIFICATION

Project No. : NK-24-R-201**Dates of receipt :** May 3, 2024**Applicant :** DRTECH Corporation**Dates of Issue :** October 7, 2024

Suite No. 1,2 Floor / Suite No. 2,3 Floor, 29,

Test Site :

Dunchon-daero 541 beon-gil, Jungwon-gu,

Nemko Korea Co., Ltd.

Seongnam-si, , Gyeonggi-do, 13216, Korea

FCC ID :

RNH-TOP8812BU

IC :

29808-TOP8812BU

FCC Applicant :

DRTECH Corporation

IC Applicant :

Drtech Corporation

Brand Name :

DRTECH

Model:

TOP-8812BU

EUT Type:

WiFi Module

Classification:

Unlicensed National Information Infrastructure(NII)

Date of Test:

May 14, 2024 ~ September 3, 2024

Applied Standard:

FCC 47 CFR Part 15.407

RSS-Gen Issue 5, RSS-247 Issue 3

The device bearing the brand name and model specified above has been shown to comply with the applicable technical standards as indicated in the measurement report and was tested in accordance with the measurement procedures specified in ANSI C63.10-2013. The client should not use it to claim product endorsement by TAF or any government agencies. The test results in the report only apply to the tested sample.

I attest to the accuracy of data and all measurements reported herein were performed by me or were made under my supervision and are correct to the best of my knowledge and belief. I assume full responsibility for the completeness of these measurements and vouch for the qualifications of all persons taking them.

1. INTRODUCTION

1.1 Test facility

The measurement procedure described in American National Standard for Methods of Measurement of Radio-Noise Emissions from Low-Voltage Electrical and Electronic Equipment in the Range of 9 kHz to 40 GHz (ANSI C63.4-2014), the American National Standard for Testing Unlicensed Wireless Devices (ANSI C63.10-2013) was used in determining radiated and conducted emissions emanating.

These measurement tests were conducted at **Nemko Korea Co., Ltd.**

The site address 165-51, Yurim-ro, Cheoin-gu, Yongin-si, Gyeonggi-do, 17042, Rep. of Korea.

2.2 Operation During Test

The EUT is the transceiver which is module supporting the 802.11a/b/g/n/ac mode(802.11a/b/g/n(20,40 MHz)/ac(20,40,80 MHz) : 2TX/2RX).

The Laptop was used to control the EUT to transmit the wanted TX channel continuously (duty cycle > 98%) by the testing program(MPtool version 3.3.5) which manufacturer supported.

The cable and attenuator loss from 30 MHz to 26 GHz was reflected in spectrum analyzer with correction factor for all conducted testing.

The EUT was tested at the lowest, middle and the highest channels with the maximum output power in accordance with the manufacturer's specifications. The worst data were recorded in the report.

2.2.4 Additional Information Related to Testing

The cable and attenuator loss from 30 MHz to 26.5 GHz was reflected in spectrum analyzer with correction factor for all conducted testing.

2.2.5 Worst-case Configuration and Mode

Radiated emission below 1GHz was performed with the EUT set to transmit at the channel with highest output power as worst-case scenario.

Radiated emission above 1GHz was performed with the EUT set to transmit low/mid/high channels.

The emissions (Band-edge & spurious emissions) were investigated in three orthogonal orientations X, Y and Z.

Accordingly, the orientation was determined and tested as shown in the table below:

Test Items	X	Y	Z
Band-edge	O	-	-
Spurious emissions	O	-	-

3. ANTENNA REQUIREMENTS

Measurement and determination of electromagnetic emissions (EME) of radio frequency devices including intentional and/or unintentional radiators for compliance with the technical rules and regulations of the Federal Communications Commission under FCC part 15 and RSS-Gen.

§15.203 of the FCC Rules part 15 Subpart C

: An intentional radiator shall be designed to ensure that no antenna other than that furnished by the responsible party shall be used with the device. The use of a permanently attached antenna or of an antenna that uses a unique coupling to the intentional radiator shall be considered sufficient to comply with the provisions of this section.

RSS-Gen Section 6.8

: The applicant for equipment certification shall provide a list of all antenna types that may be used with the transmitter, where applicable (i.e. for transmitters with detachable antenna), indicating the maximum permissible antenna gain (in dBi) and the required impedance for each antenna. The test report shall demonstrate the compliance of the transmitter with the limit for maximum equivalent isotropically radiated power (e.i.r.p.) specified in the applicable RSS, when the transmitter is equipped with any antenna type, selected from this list.

For expediting the testing, measurements may be performed using only the antenna with highest gain of each combination of transmitter and antenna type, with the transmitter output power set at the maximum level. However, the transmitter shall comply with the applicable requirements under all operational conditions and when in combination with any type of antenna from the list provided in the test report (and in the notice to be included in the user manual, provided below)

The test report shall state the RF power, output power setting and spurious emission measurements with each antenna type that is used with the transmitter being tested.

Immediately following the above notice, the manufacturer shall provide a list of all antenna types which can be used with the transmitter, indicating the maximum permissible antenna gain (in dBi) and the required impedance for each antenna type.

The transmitter has attached PCB antenna on board.

Used Antenna	
Model name	5 150 MHz ~ 5 250 MHz 5 725 MHz ~ 5 850 MHz
	Max. peak gain (dBi)
APDR-600WT	U-NII-1 : 0.7 U-NII-3 : 1.1
APDR-600S	U-NII-1 :-0.4 U-NII-3 : -0.5

4. SUMMARY OF TEST RESULTS

The EUT has been tested according to the following specification:

Name of Test	FCC Paragraph No.	IC Paragraph No.	Test Limit	Test Condition	Result	Remark
26dB Bandwidth	15.407(a)(2)	RSS-247 (6.2)	> 500 kHz	Conducted	Complies	-
6dB Bandwidth	15.407(e)	RSS-247 (6.2)	> 500 kHz		Complies	-
Occupied Bandwidth	-	RSS-247 (6.2)				-
Conducted Output Power	15.407(a)	RSS-247 (6.2)	< 1 Watt < 4 Watt(e.i.r.p.)		Complies	-
Power Spectral Density	15.407(a)	RSS-247 (6.2)	< 11 dBm/MHz		Complies	-
Radiated Spurious Emission	15.407(b) 15.205, 15.209	RSS-Gen (8.9),(8.10)	< 74 dBμV/m (PK) < 54 dBμV/m (AV) Radiated limits detailed in 15.209	Radiated	Complies	-
AC Line Conducted Emission	15.207	RSS-Gen (8.8)	FCC 15.207 Limits	Line Conducted	Complies	-

6. DESCRIPTION OF TESTS

6.1 6 dB Bandwidth / Occupied Bandwidth

Test Setup

Test Measurement Method

ANSI C63.10-2013, Section 12.4
KDB 789033 D02 v02r01, Section C
RSS-Gen section 6.7

Test Procedure

- 6 dB Bandwidth

EUTs 6 dB bandwidth is measured at low, middle, high channels with a spectrum analyzer connected to the antenna terminal while the EUTs operating at its maximum power control level. The spectrum analyzer setting is as follows.

RBW = 100 kHz

VBW > 3 x RBW

Detector = Peak

Trace mode = max hold

Sweep = auto couple

Allow trace to fully stabilize.

The bandwidth measurement function on the spectrum analyzer is used to measure the 6 dB bandwidth.

6.2 Maximum Conducted Output Power(average)

Test Setup

Test Measurement Method

ANSI C63.10-2013, Section 12.3
KDB 789033 D02 v02r01, Section E

Test Procedure

EUTs Maximum Conducted Output Power(average) is measured at low, middle, high channels with a spectrum analyzer connected to the antenna terminal while the EUTs operating at its maximum power control level.

The spectrum analyzer setting is as follows.

Measure the duty cycle, x , of the transmitter output signal.

Span to at least 1.5 times the OBW.

RBW = 1 – 5 % of the OBW, not to exceed 1 MHz

VBW $\geq$ 3 x RBW

Number of points in sweep $\geq$ 2 x span / RBW

Sweep time = auto couple

Detector = RMS

Trace average at least 100 traces in power averaging mode.

Add $10 \log(1/x)$, where x is the duty cycle.

Compute power by integrating the spectrum across the OBW of the signal using the instrument's band power measurement function, with band limits set equal to the OBW band edges.

6.3 Power Spectral Density

Test Setup

Test Measurement Method

ANSI C63.10-2013, Section 12.5
KDB 789033 D02 v02r01, Section F

Test Procedure

EUTs Power Spectral Density is measured at low, middle, high channels with a spectrum analyzer connected to the antenna terminal while the EUTs operating at its maximum power control level.

The spectrum analyzer setting is as follows.

Center frequency = Channel center frequency

Span = encompass the EBW of the signal

RBW $\geq$ 1 MHz for UNII-1 band or 500 kHz for UNII-3 band

VBW $\geq$ 3 x RBW

Detector = RMS

Sweep time = auto couple

Trace average at least 100 traces in power averaging mode

Allow the trace to stabilize.

The peak search function on the spectrum analyzer is used to determine the maximum amplitude level within the RBW.

6.4 Radiated Emissions

Test Measurement Method

ANSI C63.10-2013, Section 6.6.4.3, Section 12.7
KDB 789033 D02 v02r01, Section G

Test Procedure

The measurement was performed at the test site that is specified in accordance with ANSI C63.10-2013. The spurious emission was scanned from 9 kHz to 30 MHz using Loop Antenna and 30 to 1000 MHz using Trilog broadband test antenna. Above 1 GHz, Horn antenna was used.

For emissions testing at below 1GHz, The test equipment was placed on turntable with 0.8 m above ground. For emission measurements above 1 GHz, The test equipment was placed on turntable with 1.5 m above ground. Sufficient time for the EUT, support equipment, and test equipment was allowed in order for them to warm up to their normal operating condition. The EUT, cable, wire arrangement and mode of operation that has the highest amplitude relative to the limit was selected. Then, the turn table was rotated from 0° to 360° and an antenna mast was moved from 1 m to 4 m height to maximize the suspected highest amplitude signal. The final maximized level was recorded.

At frequencies below 1000 MHz, measurements performed using the CISPR quasi-peak detection. At frequencies above 1000 MHz, measurements performed using the peak and average measurement procedures described in ANSI 63.10-2013 section 11.12. Peak emission levels were measured by setting the analyzer RBW = 1 MHz, VBW = 3 MHz, Detector = Peak, Trace mode = max hold. Average emission levels were measured by setting the analyzer RBW = 1 MHz, VBW = 10 kHz, Detector = Peak, Trace mode = max hold. Allow max hold to run for at least 50 times (1/duty cycle) traces.

Frequency (MHz)	Field strength (microvolts/meter)	Measurement distance (meters)
0.009–0.490	2400/F(kHz)	300
0.490–1.705	24000/F(kHz)	30
1.705–30.0	30	30
30–88	100	3
88–216	150	3
216–960	200	3
Above 960	500	3

Radiated Emissions Limits per 47 CFR 15.209(a) & RSS-Gen (8.9)

6.5 AC Line Conducted Emissions

Test Measurement Method

ANSI C63.10-2013, Section 6.2

Test Procedure

The Line conducted emission test facility is located inside a 4 x 7 x 2.5 meter shielded enclosure.

It is manufactured by EM engineering. The shielding effectiveness of the shielded room is in accordance with MIL-STD-285 or NSA 65-6. A 1 m x 1.5 m wooden table 0.8 m height is placed 0.4 m away from the vertical wall and 1.5 m away from the side of wall of the shielded room. Rohde & Schwarz (ENV216) of the 50 ohm/50 μ H Line Impedance Stabilization Network (LISN) are bonded to the shielded room. The EUT is powered from the Rohde & Schwarz LISN. Power to the LISNs are filtered by high-current high insertion loss Power line filters. The purpose of filter is to attenuate ambient signal interference and this filter is also bonded to shielded enclosure. All electrical cables are shielded by tinned copper zipper tubing with inner diameter of 1 / 2 ". If DC power device, power will be derived from the source power supply it normally will be powered from and this supply lines will be connected to the LISNs, All interconnecting cables more than 1 meter were shortened by non-inductive bundling (serpentine fashion) to a 1 meter length. Sufficient time for EUT, support equipment, and test equipment was allowed in order for them to warm up to their normal operating condition. The RF output of the LISN was connected to the spectrum analyzer to determine the frequency producing the maximum EME from the EUT. The spectrum was scanned from 150 kHz to 30 MHz with 200 msec sweep time. The frequency producing the maximum level was re-examined using the EMI test receiver. (Rohde & Schwarz ESCI). The detector functions were set to CISPR quasi-peak mode & average mode. The bandwidth of receiver was set to 9 kHz. The EUT, support equipment, and interconnecting cables were arranged and manipulated to maximize each EME emission. Each emission was maximized by; switching power lines; varying the mode of operation or resolution; clock or data exchange speed; scrolling H pattern to the EUT and of support equipment, and powering the monitor from the floor mounted outlet box and computer aux AC outlet, if applicable; whichever determined the worst case emission.

Each EME reported was calibrated using the R&S signal generator.

42	5 210	7.92	6.94	2.10	12.56	23.98	13.26	22.79

Notes:

1. *Maximum Conducted(average) Power = Measured conducted power + Duty Factor
2. Total output power = $10 \log [10^{\{(Chain\ 1\ Power + duty\ factor\}/10\}} + 10^{\{(Chain\ 2\ Power + duty\ factor\}/10\}}]$
3. The following equation was used for spectrum offset :
Spectrum offset (dB) = Attenuator (dB) + Cable Loss (dB) + SMA Type Connector Loss (dB)
4. For CDD transmission, directional gain is **0.7 dBi**.

For MIMO transmission, directional gain is **0.7 dBi**.

Directional gain was calculated according to KDB662911 D01 Multiple Transmitter Output v02r01.

For power measurements on IEEE 802.11 devices employing CDD, directional gain is as follows,

$$\text{Directional gain} = G_{\text{ANT}} + \text{Array Gain} = 0.7 \text{ dB i} + 0 \text{ dB} = 0.7 \text{ dB i.}$$

Array Gain = 0 dB (i.e., no array gain) for $N_{\text{ANT}} \leq 4$;

Array Gain = 0 dB (i.e., no array gain) for channel widths ≥ 40 MHz for any N_{ANT} ;

Array Gain = $5 \log(N_{\text{ANT}}/N_{\text{SS}})$ dB or 3 dB, whichever is less, for 20 MHz channel widths with $N_{\text{ANT}} \geq 5$.

For power measurements on all devices employing MIMO, directional gain is as follows,

$$\text{Directional gain} = G_{\text{ANT}} + 10 \log(N_{\text{ANT}}/N_{\text{SS}}) \text{ dB i} = 0.7 \text{ dB i} + 10 \log(2/2) \text{ dB} = 0.7 \text{ dB i.}$$

Where N_{SS} = the number of independent spatial streams of data and G_{ANT} is the antenna gain in dB i.

For this device, MIMO mode means SM-MIMO(Spatial Multiplexing) transmission and $N_{\text{SS}} = 2$

5. E.I.R.P = Maximum conducted Power + Duty Cycle Factor + Antenna gain.

E.I.R.P was calculated by following equation according to KDB412172 D01 Determining ERP and EIRP v01.

$$E.I.R.P = P_T + G_T - L_C$$

P_T = Peak output power (dBm)

G_T = Gain of the transmitting antenna in dB i, Directional antenna gain is 0.7 dB i.

L_C = Signal attenuation in the connecting cable between the transmitter and antenna in dB. This factor of an integral antenna is negligible.

6. IC conducted output power limit = 250 mW or 11 dBm + 10 log B, whichever power is less.

B is the 99% emission bandwidth in megahertz,

IC *E.I.R.P* Limit = 1.0 W (30dBm) or 17 + 10 log₁₀B dBm, whichever power is less.

B is the 99% emission bandwidth in megahertz,

Notes:

1. *Maximum Conducted(average) Power = Measured conducted power + Duty Factor
2. Total output power = $10 \log [10^{\{(Chain\ 1\ Power + duty\ factor)/10\}} + 10^{\{(Chain\ 2\ Power + duty\ factor)/10\}}]$
3. The following equation was used for spectrum offset :
Spectrum offset (dB) = Attenuator (dB) + Cable Loss (dB) + SMA Type Connector Loss (dB)
4. For CDD transmission, directional gain is **1.1 dBi**.

For MIMO transmission, directional gain is **1.1 dBi**.

Directional gain was calculated according to KDB662911 D01 Multiple Transmitter Output v02r01.

For power measurements on IEEE 802.11 devices employing CDD, directional gain is as follows,

$$\text{Directional gain} = G_{\text{ANT}} + \text{Array Gain} = 1.1 \text{ dBi} + 0 \text{ dB} = 1.1 \text{ dBi}.$$

Array Gain = 0 dB (i.e., no array gain) for $N_{\text{ANT}} \leq 4$;

Array Gain = 0 dB (i.e., no array gain) for channel widths ≥ 40 MHz for any N_{ANT} ;

Array Gain = $5 \log(N_{\text{ANT}}/N_{\text{SS}})$ dB or 3 dB, whichever is less, for 20 MHz channel widths with $N_{\text{ANT}} \geq 5$.

For power measurements on all devices employing MIMO, directional gain is as follows,

$$\text{Directional gain} = G_{\text{ANT}} + 10 \log(N_{\text{ANT}}/N_{\text{SS}}) \text{ dBi} = 1.1 \text{ dBi} + 10 \log(2/2) \text{ dB} = 1.1 \text{ dBi}.$$

Where N_{SS} = the number of independent spatial streams of data and G_{ANT} is the antenna gain in dBi.

For this device, MIMO mode means SM-MIMO(Spatial Multiplexing) transmission and $N_{\text{SS}} = 2$

Notes:

1. The following equation was used for spectrum offset:

$$\text{Spectrum offset (dB)} = \text{Attenuator (dB)} + \text{Cable Loss (dB)} + \text{SMA Type Connector Loss (dB)}$$

2. "Measure and add $10 \log(N_{ANT})$ dB, where N_{ANT} is the number of outputs" was used for measuring in-band Total PSD.

Total PSD = Measured PSD + duty factor + 10 log(N_{ANT})

3. For CDD transmission, directional gain is. **3.71 dBi**. For MIMO transmission, directional gain is **0.7 dBi**.

Directional gain was calculated according to KDB662911 D01 Multiple Transmitter Output v02r01.

For PSD measurements on all devices employing CDD, directional gain is as follows,

$$\text{Directional gain} = G_{ANT} + \text{Array Gain} = 0.7 \text{ dBi} + 3.01 \text{ dB} = 3.71 \text{ dBi}$$

$$\text{Array Gain} = 10 \log(N_{ANT}/N_{SS}) \text{ dB} = 10 \log(2/1) = 3.01 \text{ dB}.$$

where N_{SS} = the number of independent spatial streams of data and G_{ANT} is the antenna gain in dBi.

For CDD mode of this device, $N_{SS}=1$.

For PSD measurements on all devices employing MIMO, directional gain is as follows,

$$\text{Directional gain} = G_{ANT} + 10 \log(N_{ANT}/N_{SS}) \text{ dBi} = 0.7 \text{ dBi} + 10 \log(2/2) \text{ dB} = 0.7 \text{ dBi}.$$

where N_{SS} = the number of independent spatial streams of data and G_{ANT} is the antenna gain in dBi

For this device, MIMO mode means SM-MIMO(Spatial Multiplexing) transmission and $N_{SS}=2$.

4. For FCC PSD Limit, if transmitting antennas of directional gain greater than 6 dBi was used, maximum power spectral density was reduced by amount in dB that the directional gain of the antenna exceeds 6 dBi.

Notes:

1. The following equation was used for spectrum offset:

$$\text{Spectrum offset (dB)} = \text{Attenuator (dB)} + \text{Cable Loss (dB)} + \text{SMA Type Connector Loss (dB)}$$

2. "Measure and add $10 \log(N_{ANT})$ dB, where N_{ANT} is the number of outputs" was used for measuring in-band Total PSD.
 $Total\ PSD = Measured\ PSD + duty\ factor + 10 \log(N_{ANT})$
3. For CDD transmission, directional gain is. **4.11 dBi**. For MIMO transmission, directional gain is **1.1 dBi**.
Directional gain was calculated according to KDB662911 D01 Multiple Transmitter Output v02r01.
For PSD measurements on all devices employing CDD, directional gain is as follows,
Directional gain = $G_{ANT} + Array\ Gain = 1.1\ dBi + 3.01\ dB = 4.11\ dBi$
 $Array\ Gain = 10 \log(N_{ANT}/N_{SS})\ dB = 10 \log(2/1) = 3.01\ dB$.
where N_{SS} = the number of independent spatial streams of data and G_{ANT} is the antenna gain in dBi.
For CDD mode of this device, $N_{SS}=1$.
For PSD measurements on all devices employing MIMO, directional gain is as follows,
Directional gain = $G_{ANT} + 10 \log(N_{ANT}/N_{SS})\ dBi = 1.1\ dBi + 10 \log(2/2)\ dB = 1.1\ dBi$.
where N_{SS} = the number of independent spatial streams of data and G_{ANT} is the antenna gain in dBi
For this device, MIMO mode means SM-MIMO(Spatial Multiplexing) transmission and $N_{SS}=2$.
4. For FCC PSD Limit, if transmitting antennas of directional gain greater than 6 dBi was used, maximum power spectral density was reduced by amount in dB that the directional gain of the antenna exceeds 6 dBi.

Radiated Measurements at 3meters

Notes:

- The worst-case emission was reported.
- *Pol. : H = Horizontal, V = Vertical, Mode : PK = Peak, QP = Qusi-Peak
- **AF + CL + Amp. = Antenna Factor + Cable Loss + Amplifier.
- Measurements using CISPR quasi-peak mode below 1 GHz.
- The radiated emissions testing were made by rotating EUT through three orthogonal axes and rotating the receive antenna with horizontal, vertical polarization. The worst data was recorded.
- No emission found between lowest internal used/generated frequency to 30MHz (9kHz~30MHz).
Per FCC part 15.31(o), test results were not reported.
Although these tests were performed other than open field test site, adequate comparison measurements were confirmed against 30 m open are test site.
Therefore, sufficient tests were made to demonstrate that the alternative site produces results that correlate with the one of tests made in an open field based on KDB 414788.
- The limit is on the FCC §15.209.

9. ACCURACY OF MEASUREMENT & DECISION RULE

9.1 Uncertainty Calculation

The Measurement Uncertainties stated were calculated in accordance with the requirements of measurement uncertainty contained in CISPR 16-4-2 with the confidence level of 95%

PARAMETER	UNCERTAINTY
Radiated Disturbance, Below 30 MHz	4.50 dB
Radiated Disturbance, 30 MHz to 1 GHz	4.40 dB
Radiated Disturbance, Above 1 GHz	4.58 dB

9.2 Decision rule

The choice of whether or not to include the measurement uncertainty of the measuring system used in the test in the conformance determination.:

- ☐ Application of internal procedures used in type testing where traceability of measurement uncertainty is established.
- ☒ Applying the decision that the standard used for type testing does not require it.

END REPORT
