

TEST REPORT

Certificate No. 952.01/952.02/952.03

This laboratory is accredited by American

Association For Laboratory Accreditation.

The tests reported herein have been performed

in accordance with its terms of accreditation.

Test Report No. : R141475
Issue Date : January 9, 2004

EUT Information

Applied Standard : FCC CFR 47 Part 15, Subpart C
with exception of 15.31(e) and 15.225(c)
requirements
Trade Name : RISO
Category : Duplicator with RFID System
Model Name : RZ390UI
Serial Number : 81340003

Scope

This document is a report of the radiated emission and conducted power line tests performed for the Duplicator Model Name: RZ390UI with RFID system.

Certification

Client

Company name : RISO KAGAKU CORPORATION
Address : 127-7, Taninosawa, Fukuda, Ami-machi, Inashiki-gun, Ibaraki-ken 300-1156, Japan
Telephone : +81 29 840 3159
Facsimile : +81 29 840 3164

Equipment Under Test (EUT)

Trade name : RISO
Category : Duplicator with RFID System
Model name : RZ390UI
Serial number : 81340003
Intended environment : Commercial and Light industry area
Date of receipt : December 15, 2003
EUT condition : Production prototype, not damaged
Highest clock frequency : 133MHz

Test Performed

Test started : December 15, 2003
Test completed : December 16, 2003
Location : Abiko Test site, 2971 Nakabyo, Abiko-shi, Chiba-ken, 270-1121, Japan
(A2LA Certificate No.0952-01)

Test Specification

Purpose of the test : Compliance test to the following standard
Applied standard : FCC CFR 47 Part 15, Subpart C
with exception of 15.31(e) and 15.225(c) requirements
(see the table 1 on page 5 for the details.)

Test Results (see the table 1 on page 5 for the details)

Measurement	Results*	Test method
Radiated disturbance	Complies	ANSI C 63.4:2001, EIA/TIA 603, MP-5
Conducted disturbance	Complies	ANSI C 63.4:2001, EIA/TIA 603, MP-5

*: The compliance statement is based on nominal value only.

Measurement uncertainty

Radiated disturbance (30 - 1000MHz) : +4.7 [dB] , -4.7 [dB] (k=2)
Conducted disturbance (0.15 - 30MHz) : +3.5 [dB] , -3.5 [dB] (k=2)

The coverage factor k=2 yields approx. a 95% level of confidence for near-normal distribution typical of most measurement results.

Laboratory's Certificate

Report number : R141475
Issue date : January 9, 2004

This test report is issued under the authority of:

The test has been done by:

Takayuki Okawara, Technical Manager

Misao Hakamazuka, Test Engineer

The results in this report apply only to the sample(s) tested.

The report shall not be reproduced except in full without the written approval of Japan EMC Laboratory Limited.

Table 1

47CFR Part #		Result	Comments
	15.15(b)	Pass	The product contains no user accessible controls that increase transmission power above allowable levels.
2.925	15.19	Pass	The label is shown in the label exhibit. (The label exhibit is not part of this test report)
	15.21	Pass	Information to the user is shown in the instruction manual exhibit. (The instruction manual exhibit is not part of this test report)
	15.27	Pass	No special accessories are required for compliance.
15.31(e)	15.225(c)	Test not performed	The frequency tolerance of the carrier signal with 0.01% of the operating frequency was not confirmed. The input power should be varied from its nominal value(120V) to 102V and 138V. The respective radiated power measurement was not performed.
	15.203	Pass	The device utilizes a unique antenna connector, antenna is located inside of the equipment under test and not accessible by the end user.
	15.204	Pass	Refer to antenna description(s). Only the build in antennas are to be used with the equipment under test.
	15.205 15.209	Pass	The fundamental is not in a Restricted band and the spurious emissions in the Restricted bands comply with the general emission limits of 15.209.
	15.207	Pass	Conducted EMI data on AC side of the power supply is provided in this report.
	15.225(a)	Pass	The field strength of emissions within the band of 13.553-13.567MHz is less than 15,848μV/m at 30m.

Brief Information**1. Test summary**

Test was done for compliance with FCC Rules & Regulations Part 15C(47CFR 15C) updates as of Dec.8, 2003.

ANSI. C. 63.4: 2001, EIA/TIA 603, MP-5

Frequency range to be scanned : Radiated : 30-1000MHz. 1GHz-2GHz.
Conducted:0.15-30MHz.

Open site: Filed with FCC Authorization and Evaluation division 7435
Oakland Mills Rd Columbia, MD 21046, U.S.A. on Feb.4,
2002. AVAILABLE FOR ANSI C63. 4-2001.

File Refer NO. : 31040/SIT
1300B3

Site location : 2971 Nakabyo,
Abiko-City 270-1121, Japan

Shielded enclosure : 6.3 meter by 5.4 meter and 2.5 meter high in size for AC
powerline conducted measurement.

Detector Function and Selection of Measured by the CISPR quasi-peak function Bandwidth is
Bandwidth : 10kHz in the frequency 0.15MHz to 30MHz and 120kHz in
the frequency 30MHz to 1,000MHz and 1MHz in the
frequency above 1GHz.

A sample calculation : COR. F(correction factor)= Antenna factor+Cable loss-
Amp.gain - Distance correction
Emission Level= meter reading + COR.F

2. Product description

The Equipment under the test is a digital duplicator which is able to make a print by scanning an original or sending image data from PC directly and via network. The printing sizes are up to A3 (US Ledger size) and the printing speeds are variable 60 rpm to 130 rpm. Scan is performed at a resolution D600 dpi and the highest clock frequency used in the EUT is 133MHz, which means that the measurement range for the EUT is up to 2000 MHz according to Section 15.33, FCC part 15 . The electrical rating of the EUT is 120 volt AC which frequency range is 50/60 Hz and 2.5 ampere. 3.0 meter non-shielded AC power cable is provided. The other description for the supported equipment and the cables are mentioned in the cable list on page 6 of this test report. The FRID system is a device which can read the RF-tag pasted on the consumables (Inks and Masters) and set up the EUT condition to process scanning, master-making and printing properly.

3. Test configurations

The EUT was connected to all the expected options as maximized configuration shown as "Configuration of the EUT" on page 5 and also shown as the Photographs on page 76, 77 and 78.

4. Operation

The test was carried out in accordance with the "operating modes of the EUT" on page 12

5. Comment of the Measurement

By the method of MP-5, preliminary consideration are carried out for all available mode and cable layouts for each frequency. Measurement was made maximum configuration for each frequency. The test results were found to be below the limits of FCC part 15 subpart C digital devices. The minimum margins to the limits are 4.0 dBuV/m at 38.41MHz at radiated emission measurement in the I/F parallel print mode and 2.4 dBuV at 1.07 MHz at conducted power line measurement in the stand-by mode. Radiated emission level above 1754MHz of this equipment under test was far below from FCC limits. The test regarding as 15.31(e) and 15.225(c) was not performed. See page5 for the detail.

Test Procedures**LIMITS OF RADIATED EMISSION MEASUREMENT**

Field strength limits are at the distance of 3meters, emissions radiated outside of the specified bands, shall be according to the general radiated limits in 15.209 as following:

Table 2

Frequencies (MHz)	Field Strength of Fundamental	
	uV/m	dBuV/m
30-88	100	40.0
88-216	150	43.5
216-960	200	46.0
Above 960	500	54.0

Note:

1. The lower limit shall apply at the transition frequencies.
2. Emission level (dBuV/m)=20 log Emission level (uV/m).
3. As shown in 15.35(b), for frequencies above 1000MHz, the field strength limits are based on average detector, however, the peak field strength of any emission shall not exceed the maximum permitted average limits, specified above by more than 20dB under any condition of modulation.

TEST PROCEDURES

- a. The EUT was placed on the top of a rotating table, on an open area test site, set 3meters away from the interference-receiving antenna, which was mounted on the top of a variable-height antenna tower.
 - b. The antenna is a broadband antenna, and its height is varied from one meter to four meters above the ground to determine the maximum value of the field strength. Both horizontal and vertical polarizations of the antenna are set to make the measurement.
 - c. The frequency range from 0.009 to 30MHz and 30MHz to 2GHz was searched. For each suspected emission, the EUT was arranged to its worst case and then the antenna was tuned to heights from 1 meter to 4meters and the rotate able table was turned from 0 degrees to 360 degrees to find the maximum reading.
- Photographs of the Test configuration. (Test setup photos depict maximized configuration.)

Conducted Emission Measurement**LIMITS OF CONDUCTED EMISSION MEASUREMENT**

Table 3

Frequency (MHz)	Class A (dBuV)		Class B (dBuV)	
	Quasi-peak	Average	Quasi-peak	Average
0.15-0.5	79	66	66-56	56-46
0.50-5.0	73	60	56	46
5.0-30.0	73	60	60	50

NOTE:

1. The lower limit shall apply at the transition frequencies.
2. The limit decreases in line with the logarithm of the frequency in the range of 0.15 to 0.50MHz.
3. All emanations from a class A/B digital device or system, including any network of conductors and apparatus connected thereto, shall not exceed the level of field strengths specified above.

TEST PROCEDURES

a. The EUT was placed 0.4meters from the conducting wall of the shielded room with EUT being connected to the power mains through a line impedance stabilization network (LISN). Other support units were connected to the power mains through another LISN. The two LISNs provide 50ohm/50uH of coupling impedance for the measuring instrument.

b. Both lines of the power mains connected to the EUT were checked for maximum conducted interference.

c. The frequency range from 150kHz to 30MHz was searched.

For the actual test configuration, please refer to the related item- Photographs of the Test Configuration. (Test setup photos depict maximized configuration.)

Condition of the EUTOperating Mode of the EUT

The tests have been conducted with the following operational mode(s) of the EUT.

Name of mode in the report	Description
Stand-by	Waiting for a next operation with all the switches of EUT and peripherals on.
FB Print	The following operations are performed continuously during the test: - scanning an original by moving the mirror of the scanner unit; making a master; printing 10 sheets of paper and sorting them. slipping a tape between printed paper for every 10 sheets by the Sorter(E7).
AF Print	The following operations are performed continuously during the test: - feeding an original by the ADF (E3); making a master; printing 10 sheets of paper and sorting them. slipping a tape between printed paper for every 10 sheets by the Sorter(E7).
I/F Parallel Print	The following operations are performed continuously during the test: - transmitting data from the PC (S1) to EUT via the parallel cable; making a master ; printing 10 sheets of paper and sorting them; slipping a tape between printed paper for every 10 sheets by the Sorter (E7).
Network Print	The following operations are performed continuously during the test: - transmitting data from the PC (S5) to EUT via the LAN cable; making a master ; printing 10 sheets of paper and sorting them; slipping a tape between printed paper for every 10 sheets by the Sorter (E7).

In all modes, the EUT operation is monitored by the PC(S5) via the LAN cable.
The RFID is operating in all modes excluding the "Stand-by" mode.
