GENERAL REMARKS:

The EUT's were tested in (3) orthogonal planes.

Measurements were made up to the tenth harmonic of the highest frequency transmitted.

There are (2) separate configurations that were tested.

(1) Home installation uses home style antenna and "home style" docking cradle

(2) Mobile installation uses vehicle style antenna and "vehicle style" docking cradle

The EUT transmits at 200 KHz intervals starting at 88.1 MHz and ending at 107.9 MHz.

We test home and mobile configurations at 88.7, 98.5 & 107.5 MHz. Data is reported for both configurations..

The line out port was never cabled during this "intentional radiator" testing because it shuts off the transmitter.

SUMMARY:

The requirements according to the technical regulations are

■ - met

□ - **not** met.

The device under test does

■ - fulfill the general approval requirements mentioned on page 3.

□ - **not** fulfill the general approval requirements mentioned on page 3.

Measurement Protocol

The test methodology followed during the collection of the data included within this technical report was ANSI C63.4:1992.

The EUT was powered with (120) VAC / (60) Hz during the collection of data included within.

The data is compared to the FCC Part 15 Class B limits.

The "EMI" instrumentation is capable of calculating the final emission level based on the following formula:

Level at the receiver (dB μ V) + Antenna Correction Factor (dB/M) + Cable Loss (dB) - Preamp Gain (dB) = Actual Level in dB μ V/M.

The sample calculation below is based on the actual test data collected:

Observed Level		63.5	dB μ V	
ACF	+	8.7	dB/M	
Cable Loss	+	1.4	dB	
Preamp Gain	-	<u>26.0</u>	dB	
Actual Level		47.6	dB μ V/M	@ 88.7 MHz
