The EUT was connected to a spectrum analyser via a cable and attenuator. The EUT was configured to transmit at maximum power. The audio input was initially set at a level of 50 mV and the audio frequency varied between 100 Hz and 5 kHz to show the audio frequency response.

At frequencies of 100 Hz, 1 kHz and 5 kHz, the audio input voltage was varied between 1 mV and 1000 mV to show the EUT's capability to limit the level of modulation for different input signal levels and frequencies. The results are shown on the graph below.

2.5.4 Test Method

Testing was performed in accordance with ANSI C63.26, Clause 5.5.

Prescans were performed using the direct field strength method. Any emissions found within 10 dB of the specification limit were formally measured using the substitution method.

The limit line on the prescan plots was calculated from equation c) in clause 5.2.7.

$$E \text{ (dB}\mu\text{V/m)} = \text{EIRP (dBm)} - 20\text{Log(D)} + 104.8$$

$$\text{Below 1 GHz: } 75.2 = -20 - 20\text{Log(3)} + 104.8$$

$$\text{Above 1 GHz: } 77.2 = -18 - 20\text{Log(3)} + 104.8 \text{ (limit is specified as ERP but EIRP required above 1 GHz therefore 2 dB approx. added).}$$

A 2500 Hz tone @ 50mV was applied to modulate the transmitter to achieve maximum power.

2.6.3 Date of Test

05-January-2018

2.6.4 Test Method

The EUT was connected to the spectrum analyser via an attenuator, combiner and cables. Connected to the other port of the combiner was a signal generator which was configured to the same frequency as the EUT using frequency modulation (1 kHz AF tone, 12.5 kHz deviation).

The FM demodulation mode of the spectrum analyser was used to determine whether the transient frequency behavior was within the required limits as shown in the plots below.
