FCC ID:	RXUSP200V2	REPORT DATE:	March 15, 2005
MODEL:	SP200 V2	RTL WORK ORDER NUMBER:	2004187
EQUIPMENT TYPE:	PTT VHF-H	RTL QUOTE NUMBER:	QRTL04-399
FCC Classification:	☒ TNF – Licensed Non-Broadcast Transmitter Held to Face		
FCC Rule Part(s):	Part 90: Private Land Mobile Radio Services		
Frequency Range (MHz)	Output Power (W)	Frequency Tolerance (ppm)	Emission Designator
146.075-173.075	6.5	5	16K0F3E
146.075-173.075	6.5	5	11K0F3E

We, the undersigned, hereby declare that the equipment tested and referenced in this report conforms to the identified standard(s) as described in this test report. No modifications were made to the equipment during testing in order to achieve compliance with these standards. Furthermore, there was no deviation from, additions to or exclusions from the FCC Part 2, FCC Part 90, ANSI C63.2, ANSI/TIA-603-B-2002, and ANSI/TIA/EIA 603-1.

1 GENERAL INFORMATION

1.1 SCOPE

FCC Rules Part 90 (Subpart K): This subpart sets forth special requirements applicable to the use of certain frequencies or frequency bands.

All measurements contained in this application were conducted in accordance with the FCC Rules and Regulations CFR47 Part 90 and ANSI/TIA/EIA603-B-2002 Land Mobile FM or PM Communications Equipment Measurement and Performance Standards. The measurement instrumentation conforms to the ANSI C61.1; 4.5 standard for EMI and Field Strength Instrumentation. Calibration checks are performed regularly on the instruments, and all accessories including high pass filter, coaxial attenuator, preamplifier and cables.

1.2 TEST FACILITY

The open area test site and conducted measurement facility used to collect the radiated data is located at 360 Herndon Parkway, Suite 1400, Herndon, Virginia 20170. This site has been fully described in a report and approved by the Federal Communications Commission to perform AC line conducted and radiated emissions testing (ANSI C63.2).

1.3 RELATED SUBMITTAL(S)/GRANT(S)

This is an original application for Certification. A DoC report is on file for the receiver section and digital interface for the EUT.

2 EQUIPMENT INFORMATION

2.1 TEST SYSTEM DETAILS

The EUT was received on January 11, 2005. The FCC Identifiers for all equipment, plus descriptions of all cables used in the tested system are:

TABLE 2-1: EQUIPMENT UNDER TEST (EUT)

Part	Manufacturer	Model	Serial Number	FCC ID	Cable Description	RTL Bar Code
VHF Portable Radio	Maxon	SP200 V2	0000000004	RXUSP200V2	N/A	16419
Antenna	Maxon	N/A	N/A	N/A	N/A	16420

Belt Clip	Maxon	N/A	N/A	N/A	N/A	16422

2.2 WORST CASE CONFIGURATION OF TESTED SYSTEM

FIGURE 2-1: WORST CASE CONFIGURATION OF SYSTEM UNDER TEST

3 FCC PART 2.1033(C)(8); DC VOLTAGES AND CURRENTS

The DC voltages applied to and DC currents into the several elements of the final radio frequency amplifying device for normal operation over the power range were:

7.5 volts @ 1.6A High Power
7.5 volts @ 0.63A Low Power

4 RF POWER OUTPUT - §2.1046

4.1 ANSI/TIA/EIA-603-2002, SECTION 2.2.1 TEST PROCEDURE

Connect the equipment as illustrated below. Measure the transmitter output power during the defined duty cycle. The EUT was connected to a coaxial attenuator having a 50 Ω load impedance.

FIGURE 4-1: ILLUSTRATION OF HOW THE EQUIPMENT IS CONNECTED

5 FCC PART 2 §2.1047(A): MODULATION CHARACTERISTICS - AUDIO FREQUENCY RESPONSE

5.1 TEST PROCEDURE

ANSI/TIA-603-B-2002, section 2.2.6. The audio frequency response is the degree of closeness to which the frequency deviation of the transmitter follows a prescribed characteristic. The input audio level at 1000 Hz is set to produce 20% of the rated system deviation. This point is shown as the 0 dB reference level, noted DEVref. The audio signal generator was varied from 300 Hz to 5 kHz with the input level held constant. The deviation in kHz was recorded using a modulation analyzer as DEVfreq. The response in dB relative to 1 kHz was calculated as follows: Audio Frequency Response = 20 LOG (DEVfreq/DEVref)

6 FCC PART 2 §2.1047(A): MODULATION CHARACTERISTICS - AUDIO LOW PASS FILTER RESPONSE

6.1 TEST PROCEDURE

ANSI/TIA-603-B-2002, 2.2.15

The Audio Low Pass Filter Response is the frequency response of the post limiter low pass filter circuit above 3000 Hz.

7 FCC PART 2 §2.1047(B): MODULATION CHARACTERISTICS - MODULATION LIMITING

7.1 TEST PROCEDURE

ANSI/TIA-B-603-2002, section 2.2.3

The transmitter is adjusted for full rated system deviation. The audio input level is adjusted for 60% of rated system deviation at 1000 Hz. Using this level as a reference (0 dB), the audio input level is varied from the reference to a level +20 dB above it and -20 dB under it, for modulation frequencies of 300 Hz, 1,000 Hz, and 2,500 Hz. The system deviation obtained as a function of the input level is recorded. Both Positive and Negative Peak deviations were recorded.

8 OCCUPIED BANDWIDTH - §2.1049

8.1 OCCUPIED BANDWIDTH - §2.1049 TEST PROCEDURE

The antenna output terminal of the EUT was connected to the input of a 50 ohm spectrum analyzer through a matched 10 dB attenuator. The radio transmitter was operating at maximum output power with and without internal data modulation. 100% of the in-band modulation was below the specified mask.

(b) *Emission Mask B*. For transmitters that are equipped with an audio low-pass filter pursuant to §90.211(a), the power of any emission must be below the unmodulated carrier power (P) as follows:

(1) On any frequency removed from the assigned frequency by more than 50 percent, but not more than 100 percent of the authorized bandwidth: At least 25 dB.

(2) On any frequency removed from the assigned frequency by more than 100 percent, but not more than 250 percent of the authorized bandwidth: At least 35 dB.

(3) On any frequency removed from the assigned frequency by more than 250 percent of the authorized bandwidth: At least $43 + 10 \log (P)$ dB.

(d) *Emission Mask D—12.5 kHz channel bandwidth equipment*. For transmitters designed to operate with a 12.5 kHz channel bandwidth, any emission must be attenuated below the power (P) of the highest emission contained within the authorized bandwidth as follows:

(1) On any frequency from the center of the authorized bandwidth f_0 to 5.625 kHz removed from f_0 : Zero dB.

(2) On any frequency removed from the center of the authorized bandwidth by a displacement frequency (f_d in kHz) of more than 5.625 kHz but not more than 12.5 kHz: At least $7.27(f_d - 2.88 \text{ kHz})$ dB.

(3) On any frequency removed from the center of the authorized bandwidth by a displacement frequency (f_d in kHz) of more than 12.5 kHz: At least $50 + 10 \log (P)$ dB, or 70 dB, whichever is the lesser attenuation.

9 SPURIOUS EMISSIONS AT ANTENNA TERMINAL - §2.1051

9.1 SPURIOUS EMISSIONS AT ANTENNA TERMINAL - §2.1051 TEST PROCEDURE

The level of the various conducted spurious frequencies was measured by means of a calibrated spectrum analyzer. The antenna output terminal of the EUT was connected to the input of a 50 Ω spectrum analyzer through a matched 10 dB attenuator and notch filter. The transmitter was operating at maximum power.

10 RADIATED SPURIOUS AND HARMONIC EMISSIONS - §2.1053

10.1 RADIATED SPURIOUS AND HARMONIC EMISSIONS - §2.1053

A receiving antenna located 3 meters from the turntable received any signal radiated from the transmitter and its operating accessories. The receiving antenna was varied from 1 to 4 meters.

ERP Measurements by Substitution Method:

The EUT was placed on a turntable 3 meters from the receive antenna. The EUT was placed on the turntable with the transmitter transmitting into a non-radiating load. The field of maximum intensity was found by rotating the EUT 360 degrees in all 3 orthogonal axes, and changing the height of the receive antenna from 1 to 4 meters. The field strength was recorded from a calibrated spectrum analyzer for each channel being tested. An antenna was substituted in place of the EUT. This antenna was fed by a signal generator, and the input level adjusted to the same field strength level as the EUT. The conducted power from the signal generator was recorded. The level was checked at the antenna input using a splitter to verify no impedance mismatch and corrected. The signal generator level was further corrected by subtracting the connecting cable loss, and further corrected with the transmitting antenna gain referenced to a $\frac{1}{2}$ wave dipole measurement.

The spectrum analyzer was set to the following settings: Quasi-peak below 1 GHz (120 kHz RBW/VBW); Average above 1 GHz (1MHz RBW/10 Hz VBW), sweep speed auto.

11 FREQUENCY STABILITY / TEMPERATURE VARIATION - §2.1055

11.1 MEASUREMENT METHOD

The frequency stability of the transmitter was measured by:

1. Temperature: The temperature was varied from -30°C to +50°C at intervals no more than 10°C throughout the temperature range using an environmental chamber. A period of time sufficient to stabilize all of the components in the equipment shall be allowed prior to each frequency measurement.
2. Primary Supply Voltage: The primary supply voltage was varied from 85% to 115% of the voltage normally at the input to the device, or at the power supply terminals if cables are not normally supplied. The EUT was tested down to the battery endpoint.

11.2 TIME PERIOD AND PROCEDURE

1. The carrier frequency of the transmitter was measured at room temperature (25°C to 27°C to provide a reference).
2. The equipment was subjected to a three hour "soak" at -30°C without any power applied.
3. After the "soak" at -30°C, the measurement of the carrier frequency of the transmitter was made within a three-minute interval after applying power to the transmitter.
4. Frequency measurements were made at 10°C intervals up to +50°C, then back to room temperature. A minimum period of one hour was provided to allow stabilization of the equipment at each temperature level.

11.3 FREQUENCY TOLERANCE

The minimum frequency stability shall be 5ppm.

12 FCC PART 90 §90.214: TRANSIENT FREQUENCY BEHAVIOR

12.1 TRANSIENT FREQUENCY BEHAVIOR TEST PROCEDURE

ANSI/TIA-603-B-2002 section 2.2.19

12.2 TRANSIENT FREQUENCY BEHAVIOR LIMITS

TABLE 12-1: REQUIREMENTS FOR EUT WITH 25 KHZ CHANNEL SPACING

Time Intervals (*)(**)	Maximum Frequency Difference (***)	150-174 MHz	421-512 MHz
t1(****)	± 25 kHz	5.0 mSec	10.0 mSec
t2	± 12.5 kHz	20.0 mSec	25.0 mSec
t3(****)	± 25 kHz	5.0 mSec	10.0 mSec

TABLE 12-2: REQUIREMENTS FOR EUT WITH 12.5 KHZ CHANNEL SPACING

Time Intervals (*)(**)	Maximum Frequency Difference (***)	150-174 MHz	421-512 MHz
t1(****)	± 12.5 kHz	5.0 mSec	10.0 mSec
t2	± 6.25 kHz	20.0 mSec	25.0 mSec
t3(****)	± 12.5 kHz	5.0 mSec	10.0 mSec

(*) t_{on} is the instant when a 1 kHz test signal is completely suppressed, including any capture time due to phasing. t_1 is the time period immediately following t_{on} . t_2 is the time period immediately following t_1 . t_3 is the time period from the instant when the transmitter is turned off until t_{off} . t_{off} is the instant when the 1 kHz test signal starts to rise.

(**) During the time from the end of t_2 to the beginning of t_3 , the frequency difference must not exceed the limits specified in §90.213.

(***) The difference between the actual transmitter frequency and the assigned transmitter frequency.

(****) If the transmitter carrier output power rating is 6 watts or less, the frequency difference during this time period may exceed the maximum frequency difference for this time period.

Maximum frequency difference between time T2 and T3: Calculation for Channel 8:

The frequency stability is required to be 5 PPM.

4 div. on scope represent 12.5 kHz for narrow band channel.

Therefore, 160.075 MHz times 5 PPM times +/- 4 Divisions divided by 12.5 kHz equals about +/- .26 division. .26 Div. correspond to 0.81 kHz.

13 FCC PART 2.202: NECESSARY BANDWIDTH AND EMISSION BANDWIDTH

Type of Emission: F3E; F1E; F1D

Necessary Bandwidth and Emission Bandwidth Calculation

The 25 kHz Analog modulation necessary bandwidth: $B_n = 16K0F3E$

The 12.5 kHz Analog modulation bandwidth = $11K0F3E$

Calculation:

Max modulation (M) in kHz: 3

Max deviation (D) in kHz for (25 KHz channel spacing analog): 5

Max deviation for (D) in kHz for (12.5 KHz channel spacing): 2.5

Constant factor (K): 1

$B_{n(25KHz \text{ analog})} = 2 \times M + 2 \times D \times K = (2 \times 3) + (2 \times 5 \times 1) = 16 \text{ kHz}$

$B_{n(12.5KHz \text{ analog})} = 2 \times M + 2 \times D \times K = (2 \times 3) + (2 \times 2.5 \times 1) = 11 \text{ kHz}$

Report #: 2004187
FCC ID: RXUSP200V2
Model: SP200 V2
Standards: FCC Part 90
Date: March 15, 2005

14 CONCLUSION

The data in this measurement report shows that the Maxon Telecom Co., Ltd. SP200 V2 ,
FCC ID: RXUSP200V2, complies with all the requirements of Parts 2 and 90 of the FCC Rules.
