Certificate No: 1028.01

ERRATA

This document is revision 1 to PCTC document 20060310R and is marked “Doc. 20050205R1”, dated 4/10/2006. This revision is issued to make the following additions/clarifications: (1) Added plots for the Nos. of Hopping Channels, Channel separation, Antenna Port conducted emissions and Spectral Density. (2) Revised 20 db Occupied bandwidth/bandedge measurements with proper modulations, and (3) Clarified about the setting of bandwidth used during the emission measurements (Section 4.1.1).

PREFACE

This report documents product testing conducted to verify compliance of the specified EUT with applicable standards and requirements as identified herein. EUT, test instrument configurations, test procedures and recorded data are generally described in this report. The reader is referred to the applicable test standards for detailed procedures. The following table summarizes the test results obtained during this evaluation.

SUMMARY

The Two Technologies, model JETT.XL Handheld Computer (FCC ID: RYJJETTXL) was tested to the standards listed below, and found to have the following characteristics:

TEST	STANDARD	REQUIREMENT	RESULT
Radiated Emissions - Intentional Radiation	FCC Part 15C, Section 15.247 and Section 15.205	Emissions up to 10 Harmonics in the Restricted Bands	Below Max. Permissible limit
Radiated Emissions - Spurious and Unintentional Radiation	FCC Part 15C, Section 15.209 FCC Part 15B, Class A	30 MHz – 25 GHz	Below Max. Permissible limit
Conducted Emissions - AC Power lines	FCC Part 15C, Section 15.207 FCC Part 15B, Class B	150 KHz - 30 MHz	Below Max. Permissible limit
Antenna Port	FCC Part 15C, Section 15.247	Operating Band 2.4000 MHz – 2.4835 MHz	Below Max. Permissible limit

EUT Modifications

No modifications were made on the JETT.XL handheld computer during the EMI testing.

MEASUREMENT UNCERTAINTY				
Measurement Type	Measurement Dist	Frequency Range	Measurement Limit	Expanded Combined Uncertainty
Radio Disturbance	10 meters	30 MHz to 1 GHz	Class A	4.3 dB
Radio Disturbance	10 meters	30 MHz to 1 GHz	Class B	5.0 dB
Radio Disturbance	3 meters	30 MHz to 1 GHz	Class B	4.3 dB
Conducted Disturbance	N/A	150 kHz to 30 MHz	Class A or B	3.6 dB

As all values of uncertainty are less than the CISPR 16-4:2002 recommendations, no adjustments to measured data presented in this report are required.

LAB CERTIFICATIONS/ACCREDITATIONS

The testing presented in this report is covered under one or a combination of all of the following Certifications or Accreditations.

AGENCY	CERT/REG. NUMBER

1.0 Description of the Equipment Under Test (EUT)

Equipment Identification	Handheld Computer
Model Number	JETT.XL
ID Number	Unit 1: HH301490 (No modification) Unit 2: None (with SMA connector at the antenna port)
Manufacturer	Two Technologies, Inc. 419 Sargon Way Horsham, PA 19044
Technical Contact	Philip Lanese
Condition Received	Acceptable for Test
Date Received	February 9, 2006
Sample Type	Preproduction Unit
Equipment Classification	Intentional Radiator, Unlicensed Low power Transmitter
Unisys Test Personnel	Itamar Gonen Dipak Patel

Unless otherwise noted in the individual test results sections, testing was performed on the EUT configured as follows.

1.1 General Description

The model JETT.XL is a handheld computer for commercial use. It is a transceiver incorporating Bluetooth and a serial interface. The JETT.XL uses Windows CE 5.0 as its operating system. The front face of the JETT.XL has color display and a keypad. It has an Intel PXA270 XScale microprocessor that operates at 624 MHz.

The JETT.XL handheld computer operates with a 7.2 VDC Nickel Metal Hydride (NiMH) rechargeable battery pack. The JETT.XL incorporates Maxim MAX1755 integrated Circuit voltage regulator. The battery pack can provide up to twelve hours of operating time on a full charge (depending on power management and use). The JETT.XL is supplied with 120 volts AC adaptor (Stancor model STA-5712) primarily for charging the battery pack. However in the emergency, if there is no battery installed, then the AC adaptor will supply the voltage regulator (Maxim MAX1775) on the CPU PCB with power, otherwise the battery will.

The JETT.XL integral Bluetooth operates with 79 channels with operating frequency range 2.402 - 2.480 GHz. It incorporates frequency hopping with GFSK modulation techniques.

Photo 2: JETT.XL – Rear/Side View

Photo 3: Stancor model STA-5712AC Adaptor

1.2 Test Configurations

Testing was carried out on a single EUT configuration. The EUT, mounted a wooden stand, was placed on a wooden table of 80 cm height. Since the EUT is a handheld device, it was tested with placing it in each of the three orthogonal axes for radiated emission evaluation.

Block Diagram and Cable listing

A block diagram of the EUT configuration showing interconnection cables is shown on the next page for reference. The drawings show the physical hardware layout used for the tests along with I/O cables connection and AC power distribution. A description of any external interface cable present during the test is attached to this drawing for reference.

*: Belkin Model F8T001
Bluetooth USB Adaptor

Note:
Details of interconnecting cables
are provided on the next page

Figure 1 – Block Diagram, EUT Test Configuration

List of Cable Interconnections

Reference Designation	Cable Function	Cable Type	Cable Length (feet)	Remark
1	Serial Data/Power cable	Shielded	15	-
2	12 VDC Cable	Unshielded	6.3	Part of Stancor AC Adaptor
3	19 VDC Cable	Unshielded	6.3	Part of Sunny AC Adaptor
4	Input AC Cable	Unshielded	6.5	Part of Sunny AC Adaptor

Detailed EUT Hardware Listing

The JETT.XL has a permanently attached antenna. The detail of hardware tested is listed below:

Description	Manufacturer	Manufacturer Part Number
CPU PCB	Two Technologies	14644
Sharp Display PCB	Two Technologies	13966
Power Distribution Flex Circuit FFC	Two Technologies	13967
Interface PCB	Two Technologies	14744
Compact Flash PCB	Two Technologies	14751
Charger PCB	Two Technologies	13964
Bluetooth TX/RX Module	Phillip Electronics	BGW203
Voltage Regulator	Maxim	MAX1775
Microprocessor	Intel	CY8C24223A-24SXI
AC Adaptor	Stancor	STA-5712

Test Support Items

The following device was used to verify the EUT operation.

Description	Manufacturer	Model Number	S/N or ID Number
Laptop PC	Sony	PCG-9E1L	
AC Adaptor	Sunny Computer Tech	SYS2011-6019	None
Bluetooth USB Adaptor	Belkin	F8T001, Ver. 2	None

1.3 Rationale for the Chosen Configuration

The tested configuration of the JETT.XL represents actual deliverable hardware. During the testing, the EUT was configured with serial interface connection and AC adaptor. This represents the maximum configuration of the EUT

1.4 EUT Modifications

No modifications were made on the JETT.XL handheld computer during the EMI testing.

2.0 Operation of the EUT During Testing

Unless otherwise noted in the individual test results sections, testing was performed on the EUT as follows.

2.1 General

Climatic Environment

The following were the ambient conditions in the laboratory during testing:

Temperature: $22^{\circ}\text{C} \pm 5^{\circ}\text{C}$

Relative Humidity $50\% \pm 10\% \text{ RH}$

Input Power

The JETT.XL Computer was powered from its integral battery pack. The battery was also being recharged from the Stancor model STA-5712 AC adaptor. The AC adaptor was supplied with input AC power at 120 VAC/60 Hz.

2.2 Operating Mode

During the emissions testing, the JETT.XL Computer was operated for two modes of operation

Mode 1: Continuous transmit/receive mode of operation. The EUT was communicating continuously with wireless Bluetooth interface as well as RS-232 interface.

Mode 2: As per the FCC rules, the intentional radiation/conduction testing was performed with operating the JETT.XL Computer at three selected transmission frequencies (Low, Medium and High) as identified below:

Channel 0 – 2.402 GHz (Low TX)

Channel 47 – 2.449 GHz (Medium TX)

Channel 78 – 2.480 GHz (High TX)

2.3 Rationale for the Chosen Mode of Operation

The continuous transmit/receive mode of operation simulates the actual transmit/receive application of the EUT for both the Bluetooth as well as serial interface communication. Further, as per the FCC rules, intentional radiated testing was performed at the selected three frequencies, therefore it was considered as appropriate operating modes for the EMI evaluation.

3.0 Applicable Requirements, Methods and Procedures

3.1 Applicable Requirements

The results of the measurement of the radio disturbance characteristics of the EUT described herein may be applied and, where appropriate, provide a presumption of compliance to one or more of the following requirements or to other requirement at the discretion of the client, regulatory agencies, or other entities.

USA

47 CFR, Part 15, Radio Frequency Devices,

- Subpart B, "Unintentional Radiators".
- Subpart C, "Intentional Radiators".

Canada

Industry Canada (IC) Spectrum Management and Telecommunication, Radio Standards Specifications:

- RSS-Gen, "General Requirements and Information for the Certification of Radiocommunication Equipment". Issue 1, September 2005.
- RSS-210, "Low Power License – Exempt Radiocommunication Devices (All Frequency Bands): Category I equipment", Issue 6, September 2005.

3.2 Basic Test Methods and Procedures

The applicable regulatory product family or generic standards require that radio disturbance/interference tests be performed in accordance with the following:

- C63.4, 2003 "Methods of Measurement of Radio-Noise Emissions from Low-Voltage Electrical and Electronic Equipment in The Range of 9 kHz to 40 GHz".

3.3 Deviations Or Exclusions From The Requirements And Standards

There were no deviations or exclusions from the requirements and standards.

4.0 Test Results

4.1 Radiated Emissions

4.1.1 Radiated Emissions Test Procedure

Radiated Emissions 30 MHz – 1000 MHz

Initial measurements, for the purpose of identifying suspect emissions from the equipment under test, were performed by dividing the test frequency range into the following twenty bands:

Band	Frequency Range	Band	Frequency Range	Band	Frequency Range
1)	30 - 40 MHz	8)	108 - 148 MHz	15)	570 - 670 MHz
2)	40 - 50 MHz	9)	148 - 165 MHz	16)	670 - 770 MHz
3)	50 - 88 MHz	10)	165 - 200 MHz	17)	770 - 855 MHz
4)	88 - 93 MHz	11)	200 - 300 MHz	18)	855 - 875 MHz
5)	93 - 98 MHz	12)	300 - 450 MHz	19)	875 - 892 MHz
6)	98 - 103 MHz	13)	450 - 470 MHz	20)	892 - 1000 MHz
7)	103 - 108 MHz	14)	470 - 570 MHz		

Each of these bands was monitored on a spectrum analyzer display while the turntable was initially positioned at the reference 0 degree point. A mast mounted broadband antenna was located at a distance of 3/10 meters (as applicable) from the periphery of the EUT(s). The antenna was set to a height of 1 meter, for the vertical polarity and a height of 2.5 meters, for horizontal polarity for these suspect emission scans. All emissions with amplitudes 8 dB or less below the appropriate regulatory limit were identified and saved for later source identification and investigation. This initial suspect identification procedure was repeated for turntable positions of 90, 180 and 270 degrees. The resolution bandwidth was set to 120 KHz.

The source of questionable emissions was verified by powering off the EUT(s). Those emissions remaining were removed from the suspect list. Valid suspect emissions were then maximized through cable manipulation. The highest six signals or all within 4 dB of the limit, identified during this initial investigation, were then maximized by rotating the turntable through a complete 360 degrees of azimuth and then raising the antenna from 1 to 4 meters of elevation with the turntable positioned at the angle of maximum signal level. When the EUT(s) azimuth, antenna height and polarization that produced the maximum indication were found, the emission amplitude and frequency were remeasured to obtain maximum peak and quasi-peak field strength. The frequencies and amplitudes of RFI emissions are recorded in this report in units derived as follows:

$$\text{Field Strength (dBuV/m)} = \text{meter reading (dBuV)} + \text{antenna factor (dB/m)} + \text{Cable Loss (dB)}$$

Radiated Emissions above 1 GHz

The required test frequency range above 1 GHz, was scanned manually by placing a Double Ridged Guide antenna at a distance of 3 meters from the perimeter of the equipment under test. Emissions were monitored using EMI Test Receiver ESIB 40 set for a 1 MHz resolution bandwidth with rotating the turntable through a complete 360 degrees of azimuth. Both horizontal and vertical antenna polarities were investigated for suspect emissions. The support equipment and test item(s) were powered off in turn to determine the source of the emissions. The test procedure described above for 30 –1000 MHz was observed to maximize the emissions. The measurements were made with both peak and average detectors. The field strengths were recorded as follows:

$$\text{Field Strength (dBuV/m)} = \text{Meter reading (dBuV)} + \text{Correction Factor}^*$$

* Correction Factor includes Antenna Factor (dB/m) + Cable Loss (dB) – Amplifier Gain (dB)

4.1.2 Radiated Emissions Test Results (2/9/06 – 2/24/06)**Restricted Bands Radiated Emissions Test - FCC Part 15.205**

Radiated emission scan for the harmonics and spurs emissions in the restricted bands (FCC 15.205) up to the 10th Harmonics of the fundamental transmission frequency were made. Testing was performed with the JETT.XL operating at the following transmission frequencies:

Channel 0 – 2.402 GHz (Low TX)
Channel 47 – 2.449 GHz (Medium TX)
Channel 78 – 2.480 GHz (High TX)

For each of the fundamental transmitting frequency, testing was carried out with EUT mounting in three orthogonal axes.

No emission with significant level with respect to with the limit specified by FCC Part 15.209 was detected.

Radiated Emissions Test - FCC Part 15.109 and 15.209

Emission scan for detection of spurious and unintentional radiation was performed. The recorded levels are compared with the applicable limit specified in FCC Part 15, Section 15.209 which is the same limit as FCC Part 15 specified for Class B digital devices for the test measurement frequency spectrum. Measurement scan was performed for the frequency range of 30 MHz to 25 GHz, at the test distance of 3 meters.

Testing was performed with the JETT.XL in continuous transmit/receive mode of operation. The EUT was communicating continuously with wireless Bluetooth interface as well as RS-232 interface. Emission scan was carried out with EUT mounting in all three orthogonal axes. Out of three orthogonal axes, the EUT in side orientation was determined to be worst case emission orientation. The results of the measurements with EUT in side orientation are presented on the next page. It may be noted that initially, all the detected levels were compared with the limit specified in FCC Part 15, Section 15.209. Those emission levels found to be within -1db or above the Section 15.209 limit were identified for determination RF source. If the identified emission was found to be generated by the digital circuit activity and not the TX/RX RF circuit activity then it was considered as unintentional radiated emission. In that case, the FCC Part 15.109 Class A limit for digital devices was applied. In the following table, those levels are compared with the Class A limit as identified with Note 1 in the remark column.

555.247	42.21	H	321	262	21.76	46	-3.79	

*: FCC Part 15, Section 15.209, except as noted in Note 1 below:

Note 1: Emission at this frequency was identified as unintentional emission generated by the digital circuit activity and not the TX/RX RF circuit activity. Therefore this emission level shall meet the, FCC Part 15.109 Class A limit for digital devices. This emission level is compared with the Class A limit, extrapolated to 3 meter test distance.

Overall Results: All the detected EUT signals are under the FCC Part 15, Section 15.209 limit at 3 meters or FCC Part 15, Section 15.209, Class A digital devices limit extrapolated at 3 meters, as applicable.

4.2 AC Power Lines Conducted Emissions

4.2.1 Conducted Emission Test Procedure

Peak amplitude terminal voltage emissions at the AC power input port of the Stancor model STA-5712 AC Adaptor, were measured with a receiver, using a peak detector and the appropriate CISPR bandwidth, connected to the RF output of a 50 Ohm, 50 microhenry Line Impedance Stabilization Network (LISN) installed in each power line. Peak detector emission data measurements were made over the frequency range from 150 kHz to 30 MHz while the EUT(s) was operating as described in paragraph 2.2.

Note: For speed and convenience, a receiver employing a peak detector was used to sweep through and record the spectrum. As a tool to judge compliance of the emissions, the peak detector sweep is displayed and graphed against the appropriate average limit. This type of measurement is valid given that the peak reading will always be greater than or equal to the average or quasi-peak reading. From the Peak detector emission data plot, the top six (6) emissions or any other peak emissions that exceed the average limit, or are found to be within 1 dB of the average limit, are re-measured using receiver with the detector function first set to quasi-peak and then to average. These measurements are recorded and presented in the table format below the peak emission graph.

The amplitudes of emissions measured on the AC power lines of the EUT(s) are recorded in this report in units derived as follows:

Conducted Emission (dBuV) = Meter reading (dBuV) + Correction Factor*

* Correction Factor = Cable Loss (dB) + LISN factor (dB) + Limiter Loss (dB).

4.2.2 Conducted Emissions Test Results (2/27/2006)

The conducted emissions recorded at the AC power input port of the Stancor model STA-5712 AC Adaptor for the JETT.XL, displayed against the limits for FCC 15.207 (same as FCC Class B Conducted Emission limit) are presented below:

Overall Results: All conducted emissions measured at the AC power input port of the Stancor model STA-5712 AC Adaptor for the JETT.XL, are below the FCC 15.207 limit.

Test Setup

Photo 10: Conducted Emission Test Setup, JETT.XL – Front View

Photo 11: Conducted Emission Test Setup, JETT.XL – Side View

4.3 Antenna Port (2/24/06 – 2/28/06)

4.3.1 Antenna Requirements

The antenna used for transmitting is an integral part of the JETT.XL. It is permanently attached and considered as consumer non-replacement part. The antenna has directional gain of 0 dBi.

Overall Results: The JETT.XL met the antenna requirements of FCC Part 15, Section 15.203.

4.3.2 Numbers of Hopping Channel

The JETT.XL transmits in the frequency band of 2400 MHz – 2483.5 MHz, with a total of 79 frequency hopping channels. According to the FCC Section 15.247 (a) (1) (iii), for the frequency band of 2400 MHz – 2483.5 MHz, the requirements, it shall have at least 15 channels.

The graphical plots showing each individual channels are presented on the next pages.

Overall Results: The JETT.XL met the minimum numbers hopping channel requirements of FCC Part 15, Section 15.247.

Graphical Plots for Nos. of Channels

Plot 1: Channels 0-39

Plot 2: Channels 40-78

4.3.3 Maximum Peak Output Power

According to FCC Part 15, Section 15.247 (b) (1) for the frequency hopping systems operating in the 2400 MHz – 2483.5 MHz band and employing at least 75 hopping channels, the peak output power limit is 1 Watt (30 dBm). The JETT.XL antenna port was connected directly to the spectrum analyzer through a suitable attenuator. The following table shows the result peak power measurements at the selected fundamental transmit frequencies:

Transmit Frequency	Receiver Measured Voltage Level (dBuV)	Correction Factor (dB)	Corrected Voltage Level (dBuV)	Corrected Power Output (dBm)	FCC Power Output Limit (dBm)
2.402 GHz (Low TX)	80.45	30.2	110.65	3.65	30
2.449 GHz (Medium TX)	79.00	30.2	109.2	2.20	30
2.480 GHz (High TX)	77.92	30.2	108.12	1.12	30

Overall Results: The JETT.XL conducted peak power output was below the limit specified in FCC Part 15, Section 15.247 (b) (1).

4.3.4 Frequency Separation

The JETT.XL operates with an output power no greater than 125 mw. Therefore according to the FCC Part 15, Section 15.247, the applicable hopping channel minimum separation requirement is 25 KHz or two-thirds of the 20 dB bandwidth of the hopping channel, whichever is greater. 20 dB bandwidth measurements were performed at the Low TX, MID TX and High TX channel frequencies. The 20 dB bandwidth measurement was recorded as 638.27 kHz.

The frequency separation of hopping channel was measured as 1 MHz.

The graphical plots showing channel separation at the Low TX, MID TX and High TX channel frequencies. are presented on the next pages.

Overall Results: The JETT.XL met the minimum hopping channel frequency separation requirements of the FCC Part 15, Section 15.247 (a) (1).

Frequency Separation Plots

Plot 3 – Low Frequency Separation (Channels 0, 1, and 2)

Plot 4 - Mid Frequency Separation (Channels 46, 47, and 48)

Plot 5 - High Frequency Separation (Channels 76, 77, and 78)

4.3.5 Time of Occupancy on Channel

Following table shows results of time of occupancy measurements at the selected fundamental transmit frequencies:

Transmit Frequency	Measured Time of Single Pulse	Specified Test Duration	Total Occupancy Time	FCC Limit for Time of Occupancy FCC 15.247 (a) (iii)
	Micosec	Seconds	Seconds	Seconds
2.402 GHz (Low TX)	372	31.6	0.238	0.4
2.449 GHz (Medium TX)	204	31.6	0.130	0.4
2.480 GHz (High TX)	308	31.6	0.197	0.4

Overall Results: The JETT.XL met the time of occupancy limit specified in FCC Part 15, Section 15.247 (a) (1) (iii).

4.3.6 Antenna Port Conducted Emissions Requirements

This test was performed with the JETT.XL antenna port connected directly to the spectrum analyzer through a suitable attenuator (30 db). Measurements made with a peak detector and a 100 kHz RBW. Measurement scan was performed for the frequency range of 30 MHz to 25 GHz. The purpose of this test is to demonstrate that all harmonics of the fundamental frequency and spurious Emissions from the EUT are 20 dB below from the highest emission level within the authorized band.

Measurements were performed with operating the JETT.XL Handheld Computer at three selected transmission frequencies (Low, Medium and High) as identified below:

Channel 0 – 2.402 GHz (Low TX)
Channel 47 – 2.449 GHz (Medium TX)
Channel 78 – 2.480 GHz (High TX)

Emission scan did not find any significant level with respect to the applicable limit, all the levels were considerably below the applicable limit per FCC Part 15.247 (d).

The graphical plots showing conducted emissions measurements are presented on the next pages.

Overall Results: All harmonics and spurious emissions are more than 20 dB down from the highest emissions level (80.45 dBuV + Attenuator loss) within the authorized band.

4.3.7 RF Safety - Maximum Permitted Exposure

The JETT.XL has the antenna with 0 dBi nominal Antenna Gain. Therefore the numeric antenna gain is 1 (0 dBi=10 log (numeric gain))

Based on the FCC OET Bulletin 65, Edition 97-01, power density at a distance of 20 cm was calculated as below:

$$S = \frac{P \cdot G}{4\pi R^2}$$

Where:

S=Power Density (mW/cm²)

P=Power input to Antenna (mW)

G=Antenna Numeric Gain

R=Distance from center of Radiation Antenna (cm)

Tx Freq	Ant Gain (dBi)	Antenna Gain (Numeric)	Peak Output Power (dBm)	Peak Output Power (mW)	Power Density (mW/cm ²)	*Limit of Power Density (mW/cm ²)
2.402 GHz (Low TX)	0	1	3.65	2.317	0.00046	1
2.449 GHz (Medium TX)	0	1	2.20	1.650	0.00033	1
2.480 GHz (High TX)	0	1	1.12	1.294	0.00026	1

*Limit for General Population/Uncontrolled Exposure is applied as per FCC Part 15, Section 1.1310.

Overall Results: The JETT.XL met the Maximum Permitted Exposure (MPE) requirements specified in FCC Part 15, Section 15.247 (i).

4.3.8 Power Spectral Density Requirements

This test was performed with the JETT.XL antenna port connected directly to the spectrum analyzer through a suitable attenuator.

Measurements were made for all the three selected operating test frequencies – Low TX, Mid TX and High TX.

The limit for power spectral density as specified in FCC 15.247 is 8 dBm.

The test results are presented below:

Transmit Frequency	Peak Receiver Level	Correction Factor	Corrected Voltage Level	Corrected Power Level	FCC Power Density Limit
	(dBuV)	(dB)	(dBuV)	(dBm)	(dBm)
2.402 GHz (Low TX)	80.26	30.2	110.46	3.46	8
2.449 GHz (Medium TX)	78.73	30.2	108.93	1.93	8
2.480 GHz (High TX)	77.58	30.2	107.78	0.78	8

The graphical plots showing power spectral density measurements are presented on the next pages.

Overall Results: The JETT.XL met the power spectral density requirements specified in FCC Part 15, Section 15.247 (e).

Power Spectral Density Plots

Plot 18 - Low Tx (Channel 0), Power Spectral Density

Plot 19 - Mid Tx (Channel 47), Power Spectral Density

Plot 20 - High Tx (Channel 78), Power Spectral Density

4.3.9 Bandedge Requirements

Measurements were made at the edge of the lowest and highest test frequencies.

The requirement is that the transmission signal frequency measured at 20 dB down from its peak amplitude at the lowest and highest channels shall remain within the permissible band.

The graphical plots showing bandedge measurements made at the lowest and highest channels are presented on the next pages.

Overall Results: The JETT.XL met the bandedge requirements specified by the FCC Part 15.

Bandedge Measurements Plots

Note: Marker 1 is at Lowest Tx Channel, Frequency Line F1 is at 2.4 GHz

Plot 21 - Bandedge at the Lowest Tx Frequency

Note: Marker 1 is at Highest Tx Channel, Frequency Line F1 is at 2.4835GHz

Plot 22 - Bandedge at the Highest Tx Frequency

4.3.10 20 dB Occupied Bandwidth Measurements

Measurements were made for all the three selected operating test frequencies – Low TX, Mid TX and High TX.

The test results are presented below:

Transmit Frequency	Occupied Bandwidth
	(kHz)
2.402 GHz (Low TX)	637.27
2.449 GHz (Medium TX)	655.31
2.480 GHz (High TX)	622.24

The graphical plots showing occupied bandwidth measurements are presented on the next pages.

Overall Results: Average overall occupied bandwidth of the JETT.XL was determined as 638.27 kHz.

Occupied Bandwidth Plots

Note: Trace on Max hold for 20 minutes. Signal on the left is Channel 1

20 dB Bandwidth = 637.27 kHz

Plot 23 – Occupied Bandwidth at Low Tx Frequency

Note: Trace on Max hold for 20 minutes. Signal on the left is Channel 1
20 dB Bandwidth = 655.31 kHz

Plot 24 – Occupied Bandwidth at Mid Tx Frequency

Note: Trace on Max hold for 20 minutes. Signal on the left is Channel 78
20 dB Bandwidth = 622.24 kHz

Plot 25 – Occupied Bandwidth at High Tx Frequency

Appendix A – Test Equipment

Description	Freq Range (Hz)	Model Number	Manufacturer	ID / SN	Last Cal Date
EMI Test Receiver/Analyzer	20 Hz – 40 GHz	ESIB 40	Rohde & Schwarz	C-062	12/19/2005
Antenna	25M - 2G	LPB-2520/A	ARA	B965	9/26/2005
Antenna	1G – 18G	96001	EATON	U926	5/12/2005
Antenna	18G – 26.5G	DBE-520	DEMORNAY	D485	9/9/2005
Controller, Tower and Turntable	NA	2090	EMCO	B812	NA
Amplifier	1G – 40G	NSP4000-44	Miteq	B827	9/14/2005
EMI Test Receiver/Analyzer	20 Hz – 26.5 GHz	ESIB 26	Rohde & Schwarz	C232	3/18/2005
Filter, Bandpass	0.15M - 30M	NA	Unisys	NA	NA
Limiter, Pulse	DC - 30M	ESH3-Z2	Polarad	NA	NA
LISN	9k - 30M	MN 2053	Chase	U775	10/17/2005
