1.3. Measurement Uncertainty

The result of a measurement is only an approximation or estimate of the value of a specific quantity.
And thus the measurand is complete only when a statement of uncertainty is given.
KEC quotes Measurement Uncertainty (U) as follows.

Conducted Disturbance at Mains Port (150kHz-30MHz)	+3.1 / -3.7 dB
Conducted Disturbance at Mains Port (9kHz-30MHz)	+3.4 / -4.3 dB

Peak Conducted Output Power Measurement	+1.0 / -1.0 dB
Harmonics Currents Emissions	+/- 6.5 %
Voltage Change, Voltage Fluctuations and Flicker	+/- 2.3 %

Expiration Date : 2015/9/30

The above values are calculated as Expanded Uncertainty (k=2 [95%]).

[Note]

If the measured result is below the specification limit and a margin is less than the above measurement uncertainty, it is impossible to determine compliance at a level of confidence of 95%. However, the measured result indicates high probability that the tested device complies with the specification limit.

4. AC POWER LINE CONDUCTED EMISSION MEASUREMENT

4.1. Test Procedure

- (1) The EUT is placed in accordance with ANSI C63.4.
- (2) The EUT is activated as to simulate a worst data rate.
- (3) Connect the EUT's AC power cord to one Line Impedance Stabilization Network (LISN).
- (4) Any other power cord of other equipment is connected to a LISN different from the LISN used for the EUT.
- (5) Connect the spectrum analyzer (*1) to the measuring port of the LISN for the EUT, using a calibrated coaxial cable.
- (6) To find out the maximum emission of the configuration of the EUT System, the operation mode and the position of the cables are changed, then preliminary conducted measurement are performed.
- (7) The spectrums are scanned from 150kHz to 30MHz and collect the six highest emissions minimum on the spectrum analyzer relative to the limits in the whole range.
- (8) The test receiver (*2) is connected to the LISN for the EUT, and the six highest emissions minimum recorded above are measured.

6. MAXIMUM PEAK OUTPUT POWER

6.1. Test Procedure

- (1) Connect the EUT RF output port to wideband power meter via calibrated coaxial cable and suitable attenuator (if necessary).
- (2) Activates the EUT System and execute the software prepared for test, if necessary.
- (3) To find out the worst condition, the transmitting data rate of EUT is changed.
- (4) If the transmitter does not transmit continuously, measure the duty cycle, x , of the transmitter output signal.
- (5) Measure the average power of the transmitter.
- (6) Adjust the measurement in dBm by adding $10 \log(1/x)$ where x is the duty cycle.

8. SPURIOUS EMISSION

8.1. Test Procedure

Radiated measurement

(1)

The EUT is placed in accordance with ANSI C63.4.

(2)

The EUT is activated as to simulate an wort datarate.

(3)

To find out the maximum emission of the configuration of the EUT System, the position of the cables are changed, then preliminary radiated measurement are performed using the spectrum analyzer ,the broad band antenna and the horn antenna.

(4)

The spectrums are scanned from 30MHz to 1GHz, and collect the highest emissions on the spectrum analyzer (*1) relative to the limits in the whole range.
In the frequency above 1GHz, it is performed using the spectrum analyzer (*1) and the horn antenna.

(5)

The highest emissions are measured at the specified distance using the test receiver (*2) and the broad band antenna or the tuned dipole. In the frequency above 1GHz, the measurements are performed by Bore-sight method using the spectrum analyzer (*3) and the horn antenna (*4).

Conducted measurement

(1)

Connect the EUT RF output port to the spectrum analyzer (*5) via calibrated coaxial cable and suitable attenuator (if necessary).

(2)

The EUT is activated as to simulate an wort data rate.

[Calculation method]

Maximum Field Strength (dBμV/m)

= Meter Reading (at maximum level of Horizontal or Vertical) (dBμV) + Correction Factor (dB/m) – Distance factor (*)

- (*) Applied for Radiated Emission Measurement (above 12.4GHz) only.
Distance factor : 20 × log10 (3m/1m) = 9.5dB

Field Strength to EIRP conversion calculation

$$EIRP = ((E \times d)^2) / 30$$

E is the field strength in V/m;

d is the measurement distance in meters;

EIRP is the equivalent isotropically radiated power in watts.

$$EIRP(dBm) = E(dB\mu V/m) + 20 \times \log(d(meter)) - 104.77$$

d is 3 meter:

$$EIRP(dBm) = E(dB\mu V/m) - 95.2$$

9. IN-SERVICE MONITORING FOR CHANNEL MOVE TIME, CHANNEL CLOSING TRANSMISSION TIME

9.1. DFS related operating mode

☐ Master
☐ Client with radar detection
☒ Client without radar detection

9.2. DFS Requirement

Table 1 : DFS Detection Thresholds for Master Devices and Client Devices With Radar Detection

Maximum Transmit Power	Value (See Notes 1,2,and 3)
EIRP $\geq$ 200 milliwatt	-64 dBm
EIRP < 200 milliwatt and power spectral density < 10 dBm/MHz	-62 dBm
EIRP < 200 milliwatt that do not meet the power spectral density requirement	-64 dBm
Note 1 : This is the level at the input of the receiver assuming a 0 dBi receive antenna.	
Note 2 : Throughout these test procedures an additional 1 dB has been added to the amplitude of the test transmission waveforms to account for variations in measurement equipment. This will ensure that the test signal is at or above the detection threshold level to trigger a DFS response.	
Note 3 : EIRP is based on the highest antenna gain. For MIMO devices refer to KDB Publication 662911 D01.	

Table 2 : DFS Response Requirement Values

Parameter	Value
Non-occupancy period	Minimum 30 minutes
Channel Availability Check Time	60 seconds
Channel Move Time	10 seconds See Note 1.
Channel Closing Transmission Time	200 milliseconds + an aggregate of 60 milliseconds over remaining 10 second period. See Notes 1 and 2.
U-NII Detection Bandwidth	Minimum 100% of the U-NII 99% transmission power bandwidth. See Note 3.
Note 1 : Channel Move Time and the Channel Closing Transmission Time should be performed with Radar Type 0. The measurement timing begins at the end of the Radar Type 0 burst.	
Note 2 : The Channel Closing Transmission Time is comprised of 200 milliseconds starting at the beginning of the Channel Move Time plus any additional intermittent control signals required to facilitate a Channel move (an aggregate of 60 milliseconds) during the remainder of the 10 second period. The aggregate duration of control signals will not count quiet periods in between transmissions.	
Note 3 : During the U-NII Detection Bandwidth detection test, radar type 0 should be used. For each frequency step the minimum percentage of detection is 90 percent. Measurements are performed with no data traffic.

9.3. Test Procedure

- (1) Configure the EUT for normal transmissions with a channel loading of approximately 17% or greater.
- (2) Refer as KDB Publication No. 905462 D02 UNII DFS Compliance Procedures New Rules v01r02.

[Test setup]

The rated output power of the Master unit is $\geq 200\text{mW}$. Therefore the required interference threshold level is -64dBm . After correction for antenna gain and procedural adjustments, the required conducted threshold at the antenna port is $-64 + 1 + 0 = -63.0\text{dBm}$ (threshold level + additional 1dB + antenna gain)

APPENDIX A (DECLARATION OF COMPLIANCE TO MAXIMUM PERMISSIBLE EXPOSURE LIMITS FOR HUMANS)

The Model WYSAAVDXB-E with 5150-5850MHz transmitter complies with Maximum permissible exposure limits for humans as called out in §1.1310. It is exempt from Maximum Permissible Exposure based on its operating frequency, and power density 0.01mW/cm².

Calculation formula :

$$S = PG / 4\pi D^2$$

S : power density (W/m²)

P : peak output power (W)

G : antenna gain (isotropic)

D : measurement distance (m)

Where :

P = 11.62dBm at 5785 MHz, 11a (see 50 page)

G = 2.4dBi

D = 0.2m

Therefore :

$$S(W / m^2) = \frac{10^{\frac{11.62}{10}} \times 10^{-3} \times 10^{\frac{2.4}{10}}}{4 \times \pi \times 0.2 \times 0.2} = 0.050$$

$$S \doteq 0.005 (mW/cm^2)$$

This would be less than 1mW/cm² when the separation distance between the user and the device's radiating element is less than 20cm.
